

When the market heats up, charts don't lie. Ethereum's bullish triangle is turning heads with a potential move to \$1,817, while XRP price action is echoing historic patterns that hint at a possible breakout. Both assets are drawing attention, but it's BlockDAG that's adding a strategic twist to its momentum. While ETH and XRP show technical promise, BlockDAG is making headlines for a different reason: slashing its token price to \$0.0025 in presale batch 27. This rollback from \$0.0248 gives investors a rare second chance at early-stage pricing, setting it apart from top crypto projects approaching critical points.

Ethereum (ETH) Price Forecast The Ethereum (ETH) price forecast is gaining traction as a bullish triangle pattern forms on the chart, signaling a potential breakout. Currently, ETH has been consolidating just below the \$1,690 resistance, and technical indicators suggest upward pressure is building. Consequently, a clear push above this level could trigger a move toward the \$1,817 mark, backed by increasing trading volume and a rising Relative Strength Index (RSI). Moreover, the 50-day moving average is also trending upward, reinforcing positive momentum. If buyers sustain control, the next key resistance level to watch lies near \$1,900. On the other hand, failure to break \$1,690 might result in a short-term pullback toward the \$1,630 support zone. Overall, the current setup presents a cautiously optimistic Ethereum (ETH) price forecast, with market participants eyeing confirmation of a breakout. Therefore, close monitoring of support and resistance levels will be essential in the coming days as ETH inches closer to a decisive move.

XRP Price Action Echoes Historic Patterns XRP price action is drawing attention as analysts identify patterns reminiscent of previous significant market movements. For example, crypto analyst RizeSenpai highlights a multi-year consolidation phase in XRP's chart that mirrors Bitcoin's behavior from 2015 to 2017. As a result, this analysis suggests a potential surge to \$71, representing a substantial increase from its current value. Furthermore, supporting this perspective, analyst EGRAG CRYPTO points to XRP's current positioning above key moving averages, similar to conditions before its notable rally in 2017. In addition, he identifies a symmetrical triangle formation in XRP's chart, a pattern that historically precedes significant price movements. If XRP follows this pattern, it could experience a breakout leading to prices between \$27 and \$33. Moreover, technical indicators, such as the Moving Average Convergence Divergence (MACD), are showing signs of a hidden bullish divergence, which often signals the continuation of an uptrend. Taken together, these analyses suggest that XRP price action may be on the cusp of a significant upward movement, reflecting patterns observed in past market cycles.

BlockDAG Fires Up Presale with \$0.0025 Rollback and Buyer Battles Twist BlockDAG's presale has hit batch 27, and the momentum is ramping up with two powerful moves turning heads across crypto communities. First, the project has rolled back the BDAG token price to just \$0.0025, a sharp drop from the prior \$0.0248. Notably, this rollback unlocks a rare second chance for both early and latecomers to secure a position at near-initial prices before launch. With over \$217.5 million already raised and more than 19.3 billion coins sold, the demand signals real traction. In addition, to amplify participation, BlockDAG has also introduced Buyer Battles, a daily competition that rewards the top buyer. Each day, 25 million BDAG are allocated for purchase. If the batch doesn't sell out, the unsold tokens are handed to the day's biggest buyer. Therefore, this gamified approach gives the final stretch of the presale a competitive edge, encouraging real-time engagement instead of passive accumulation. Currently priced at \$0.0025, BDAG has delivered a 2,380% ROI since batch 1, attracting attention from those tracking top crypto projects ahead of their launch cycles. Importantly, Buyer Battles adds an extra layer of incentive to what's already become one of the most talked-about presales in Web3 this year. With the project nearing its mainnet debut, the timing and price structure are positioning BlockDAG as one of the most accessible high-upside plays for new and returning investors alike.

BlockDAG's Strategic Rollback Stands Out While Ethereum eyes a breakout above key resistance and XRP price action draws comparisons to historic rallies, BlockDAG is carving a different path. Its decision to roll back the token price to \$0.0025 during presale batch 27 is more than a discount, it's a calculated move that puts early access back on the table. With strong fundraising, competitive gamification through Buyer Battles, and a clear growth trajectory, BlockDAG is building traction through strategy rather than speculation. As other top crypto projects await technical confirmation, BlockDAG's presale mechanics are already capturing attention with tangible incentives.

Crypto investors are carefully analyzing top performers like Solana (SOL) and Ethereum (ETH) to position themselves for potential gains in 2025. Both have proven track records, strong ecosystems, and high institutional interest. But while blue-chip assets show steady growth potential, emerging projects like Ozak AI (OZ) are creating significant buzz—especially with its presale entry point of \$0.003 and a projected price target of \$1. Backed by over \$1 million raised, Ozak AI's blend of artificial intelligence and decentralized infrastructure is giving it an edge many believe could lead to massive outperformance.

Solana (SOL) Price Prediction Solana has bounced back impressively from previous network outages, with strong developer activity and thriving DeFi and NFT ecosystems. As of now, SOL trades around \$134, with bulls aiming to retest the major resistance near \$190. A successful breakout could push prices toward \$240, especially if broader market sentiment remains bullish. However, support sits near \$125, and any weakness in Bitcoin or macro indicators could pressure Solana's gains. While still considered a top altcoin with massive potential, its upside may be more modest compared to earlier phases of its growth cycle.

Ethereum (ETH) Price Prediction Ethereum remains the backbone of the decentralized world. With the transition to Ethereum 2.0 and widespread adoption of Layer-2 solutions like Arbitrum and Optimism, ETH is more scalable and sustainable than ever. Analysts predict Ethereum could climb to \$3,500 by the end of 2025, with key resistance near

\$3,200 and support around \$2,800. That said, Ethereum's large market cap limits explosive growth. While institutions continue to embrace it, newer investors may be drawn to smaller-cap projects that offer significantly higher ROI in a shorter time frame. Ozak AI (OZ): Undervalued with 300x Potential Ozak AI is quietly turning into one of the most talked-about early-stage crypto projects. It merges artificial intelligence with blockchain through tools like the Ozak Stream Network (OSN), DePIN (Decentralized Physical Infrastructure Networks), secure Data Vaults, and advanced Prediction Agents. These tools are not just conceptual—they're designed for real-time data-driven decisions across industries. With a current Ozak AI presale price of \$0.003, and a forecasted long-term target of \$1, Ozak AI could deliver up to 300x returns if adoption meets expectations. Strong early fundraising—crossing the \$1M milestone—reflects growing market confidence in the project's potential. Support is forming at \$0.005, while resistance is likely at \$0.01, and a breakthrough at that level could lead to exponential growth. Unlike meme coins that rely solely on hype, Ozak AI combines real-world utility, innovation, and decentralized infrastructure—factors that appeal to investors seeking both value and vision. Solana and Ethereum remain strong players in the crypto space with solid foundations and steady growth outlooks. However, Ozak AI offers a different kind of opportunity—a chance to get in early on a utility-rich, AI-driven platform at a fraction of the cost. With smart technology, a rising user base, and a massive upside forecast, this \$0.003 gem might just outperform even the biggest names in the next market cycle. About Ozak AI Ozak AI is a blockchain-based project that provides a technology platform that specializes in predictive AI and advanced data analytics for financial markets. Ozak AI helps crypto investors and businesses in decision-making by providing real-time, accurate, and actionable insights through machine learning algorithms and decentralized network technologies. For more visit: - Website: <https://Ozak.ai/> - Telegram: <https://t.me/OzakAGI> - Twitter : <https://x.com/Ozakagi> Disclaimer: TheNewsCrypto does not endorse any content on this page. - Justin Sun speculates that the price of Ethereum will hit \$5,000 before July 2025, and its 10th anniversary. - The given price target by Sun is around 200% up compared to the current levels. So, Sun also made some plans to reach his given target. Justin Sun, a crypto billionaire and the founder of the Tron blockchain, has speculated that the price of Ethereum will hit \$5,000 before its 10th anniversary in July 2025. After this statement, some debates ignited in the crypto industry as the price of Ethereum is currently hovering below \$2,000 and is at \$1,807 at the time of writing. However, he retweeted a post of the Ethereum Foundation and mentioned, "Ethereum shares the same birthday as me; this date is truly meaningful. I suggest a 10x increase, let's commemorate it together at \$5,000." Sun Proposes Strategic Shifts to Drive Ethereum's Price Surge The given price target by Sun is around 200% up compared to the current levels. Sun also shared some plans to reach his given target. As per him, the Ethereum Foundation should stop selling ETH for around three years to restrict supply and encourage holding. Rather than selling tokens, the Foundation should employ lending and staking platforms like AAVE to operate finances. Also, Sun advised that the Foundation must keep only the best developers to improve output quality. He further went on to add that the development should be targeted at improving the core Layer 1 network rather than diluting resources in multiple projects. At the time of writing, the price of Ethereum was 2.03% up in the past 24 hours and was hovering at \$1,807. At the same time, the volume also witnessed a surge of 10.09% and is at \$16.66 billion. The market capitalization is currently at \$217.89 billion. As per market analysts, if the prices go up, then the first resistance (1-day time-frame) that the token will test is \$2,347, followed by the second resistance at \$2,535. Now, the market members are excited to see if the target set by Justin Sun is achieved. Highlighted Crypto News Today:

Crypto watchers are zeroing in on select names that have shown big moves or have news that could trigger major upside. With the market buzzing over Ethereum ETF flows, Solana's steady price climb, and XRP's bullish setup, there's no shortage of potential gainers. But the real excitement this year isn't only in the known names, it's also in networks like BlockDAG that are drawing massive traction through smart presale strategies. If you're scanning for high growth cryptos for 2025, this list walks through the most updated picks based on recent price action, presale data, user traction, and real announcements as of April 25, 2025. Each of these coins is backed by a narrative that's fueling strong interest right now, and one of them just unlocked its best deal of the year. 1. BlockDAG: \$0.0025 Reset Ignites Presale Rush BlockDAG is making headlines after slashing its presale price back to \$0.0025, giving top buyers a shot at early-stage pricing right before launch. This rollback mirrors the EOS-style buyer battle format, but analysts say BlockDAG could outdo EOS's \$4.1 billion raise. With over \$217.5 million already secured and more than 19.3 billion BDAG coins sold, the timing has triggered major FOMO across Telegram and Reddit. The project's estimated listing price remains at \$0.05, setting up a potential 2,380% return. What makes BlockDAG a standout among high growth cryptos for 2025 is not just the price angle but the pace of ecosystem rollouts. Its X1 app has crossed 1 million users, and over 17,000 ASIC miners have shipped to support the network. The beta testnet is already live, running over 800 TPS. With CEX listings coming and a mainnet launch locked in for August 2025, BDAG is tracking toward one of the strongest presale-to-launch runs in the market. 2. Ethereum: ETF Momentum Brings New Inflows Ethereum is trading around \$1,768 as of April 25, 2025, with recent ETF inflows grabbing attention. A total of \$63.5 million poured into ETH ETFs this week, with ETHA alone bringing in \$40 million. This strong institutional interest is helping Ethereum hold above the \$1,750 level despite market volatility. Analysts are watching the \$1,800 breakout point closely, with expectations of a push toward \$2,000 if buying volume continues to grow. Ethereum's position as one of the high growth cryptos for 2025 comes from both infrastructure dominance and recent traction in staking and L2 scaling. With ETH remaining the backbone of DeFi and AI-driven

protocols flocking to its network, long-term holders are stacking again even as short-term traders tread cautiously. This week's ETF flows hint at a shift in sentiment that could accelerate quickly if momentum holds.

3. Solana: Price Holds Above \$150 with Strong Weekly Gains Solana is currently priced at \$151.12 and is up over 20% in the last 7 days. This week's action has caught the attention of traders and analysts alike, especially as Solana holds steady above the \$150 support. Forecasts predict a move to \$160.14 within the next 48 hours if current volumes are sustained. This would confirm a strong short-term trend, with some momentum models pointing to a breakout month ahead. With multiple DeFi and NFT projects still anchored to the network, Solana's growth outlook is firm. For those looking at high growth cryptos for 2025, the network's improved uptime and bullish technicals are key reasons for inclusion. The ongoing ETF-driven market optimism has spilled over into altcoins, and SOL is one of the few names holding gains across weekly timeframes. If the \$160 level breaks soon, it could open up room for an extended move higher.

4. XRP: Price Surge and Bold Long-Term Targets XRP is priced at \$2.18 after touching \$2.25 earlier this week. It's down slightly in the past 24 hours, but overall sentiment remains strong. Analysts on major crypto channels have described XRP's chart as one of the most interesting setups currently in play, calling for it to outperform peers. This optimism is backed by increased whale activity and higher on-chain movement, both of which suggest accumulation is underway. Some analysts have floated bold predictions of XRP hitting \$100 or even \$1,000 in the long term, though most consider those levels highly speculative. That said, even a move back toward its previous all-time highs would represent a major gain from current levels. With court-related uncertainty largely out of the picture now, XRP is back on the radar for those chasing high growth cryptos for 2025. If price closes above \$2.20 consistently, momentum could build up fast.

Key Insights Each of these networks has a catalyst that makes it worth watching right now, whether it's Ethereum's ETF flows, Solana's price strength, or XRP's setup. But one name is clearly driving the most buzz today. BlockDAG's price rollback to \$0.0025 has created one of the biggest limited-time windows in the presale market. With 1M+ users, real tech milestones, and exchange listings around the corner, it's the kind of setup crypto buyers look for when scanning high growth cryptos for 2025. If you're building your shortlist for the year, make sure you're watching price action, but also which coins are actually delivering on roadmap promises. BlockDAG is doing both. Combined with the 2,380% upside from its rollback price to launch, it's currently the most aggressive setup among all high growth plays this cycle.

- Ethereum holds its ground near the \$1.7K level. - Over \$41.59 million worth of ETH has been liquidated from the market. Today's brief uptick in the crypto market has resulted in the assets bouncing between red and green charts. The largest assets, Bitcoin and Ethereum, have entered the recent high range in price. Will the bulls tighten the grip and kickstart a rally soon? The spike in the market has sent the assets to trade on the upside. Whereas, the largest altcoin, Ethereum (ETH), stayed back in the bearish zone with a 1.04% gain. ETH's mighty bearish trend line will only see a recovery if it crosses over \$2K. Ethereum opened the day trading at \$1,755, and gradually it slipped to the range of \$1,740. The bulls in command have driven the ETH price to a daily high of \$1,802 after smashing through the resistance at \$1,784. As of now, Ethereum traded within the \$1,774 mark, with the daily trading volume having plummeted by over 20%, reaching \$14.4 billion. In addition, the market has witnessed a liquidation of \$41.59 million worth of Ethereum in this interval, as per Coinglass data.

When Will ETH Break Into the Strong Bullish Zone? ETH's downside correction reported on the four-hour trading window was formed after a brief uptrend. The bears have re-entered to pull back the price to its former lows, which might send it toward the \$1,703 range. The emergence of a death cross could trigger a slip to around \$1.6K. On the upside, if the bulls wake from their sleep, it may initiate an uptrend, and Ethereum could move up to the nearby resistance in the \$1.8K mark. Assuming the extended stay of ETH bulls, it might push the price upward, with the potential of hitting the long-awaited \$2K threshold. The MACD line of Ethereum has crossed below the signal line, implying a bearish crossover. The asset's price is likely in a downtrend, and there's a potential sell signal. But ETH's CMF indicator, stationed at 0.21, signals an inflow of money, with buying pressure higher than selling pressure. Moreover, the RSI is found at 62.52, suggesting the asset's neutral condition. Besides, the asset's BBP reading of 46.78 indicates that the market sentiment is leaning toward the bulls, but not strongly.

In 2025, the crypto conversation is no longer what it used to be. While Ethereum and Solana are still dominating the headlines, there's a new player on the block. But investors are beginning to wonder: Is it time to rotate into newer tokens such as Rexas Finance (RXS)?

Ethereum (ETH): The OG Still Holding Strong Ethereum has earned its stripes. It is still the basis for DeFi, NFTs, and smart contracts. With ETH fully stabilized as the proof-of-stake chain and Layer 2 scaling solutions booming, ETH remains a long term favorite for institutions and developers alike. However, slower growth comes with maturity. The explosive 100x potential? ETH might still climb. That era may be behind us.

Solana (SOL): Fast, Scalable, and Still Rising Solana's speed and efficiency have made it the chain of choice for high-frequency apps, especially in gaming and DeFi. Its ecosystem has grown up quickly, and SOL is no longer just a speculative bet; it's a real layer-one contender with real usage. Again, how much higher can it go from here? Speculative has become more stable. Welcome to

Rexas Finance (RXS): The Fresh Frontier Unlike other altcoins, Rexas Finance is a completely new concept of asset ownership. Rexas is building a bridge between traditional finance and the blockchain future by making real-world assets (RWAs) such as real estate, art and commodities tokenizable and tradable. RXS, the native token, is at the core of a sleek ecosystem of tools such as the Rexas Token Builder and QuickMint Bot. These assets can be tokenized with these tools so that anyone from creators to real-world asset holders can easily launch and manage asset-backed tokens. No coding. No middlemen.

Just full ownership, fast minting, and on-chain liquidity. Unlike legacy chains, Rexas isn't trying to patch an old system. It's starting something new from scratch—built for 2025 and beyond. So, ETH & SOL Stick Or Rotate Into RXS? ETH and SOL have set the tone. However, newer tokens like RXS are building the skyscrapers on top. Ethereum is trusted. Solana is fast. Rexas is future-forward. If you're looking for the next wave of exponential growth, fresh utility, and mass market adoption, Rexas Finance has an appealing thesis and one that lines up with where Web3 is going: real world integration, ease of use, and permissionless creation. Bottom line? It's not a question of abandoning ETH or SOL. It's about evolving your portfolio. And in 2025, that evolution points to Rexas. RXS isn't just the next token; it's the next narrative. - Website: <https://rexas.com> - Whitepaper: <https://rexas.com/rexas-whitepaper.pdf> - Twitter/X: <https://x.com/rexasfinance> - Telegram: <https://t.me/rexasfinance> Disclaimer: TheNewsCrypto does not endorse any content on this page. The content depicted in this Press Release does not represent any investment advice. TheNewsCrypto recommends our readers to make decisions based on their own research. TheNewsCrypto is not accountable for any damage or loss related to content, products, or services stated in this Press Release.

- Hoskinson warns that Ethereum may collapse within 15 years due to its flawed design. - ETH price drops to \$1,770 as critics debate its future and rising complexity. Cardano founder Charles Hoskinson has voiced doubts about Ethereum's long-term viability. In a recent interview with Altcoin Daily, followed by an AMA session, Hoskinson suggested Ethereum may not last the next 10 to 15 years. His statement has stirred discussions within the crypto industry, especially given Ethereum's position as the second-largest digital asset by market cap. Hoskinson expressed his concern about how Ethereum's increased usage of Layer 2 networks threatened its essential architecture. Hoskinson suggested Layer 2 extensions might take away value from Ethereum rather than improving its scalability capabilities. Hoskinson discussed structural failures by comparing them to the demise of Myspace and BlackBerry because successful companies tend to fail after their systems become too complex to manage. He remarked, "Ethereum is becoming a victim of its own success," referring to the growing challenges surrounding the network's architecture and governance. Ethereum's Core Design Flaws Raise Long-Term Viability Concerns Hoskinson identified multiple technical issues with Ethereum blockchain. His analysis targeted Ethereum's financial record system along with its virtual processor and the method used to validate transactions. In his view, Ethereum's current proof-of-stake model is ineffective and may fail in the long run. He emphasized that the Ethereum Foundation selected the wrong protocols from the beginning. Hoskinson sees past decisions as major factors which lead to network inefficiencies and may cause future collapse. Hoskinson pointed out the central problem within Ethereum which consisted of its failure to institute blockchain-based governance for handling ongoing issues. According to Hoskinson this weak internal governance structure prevents Ethereum from properly evolving since it does not perform as well as alternative blockchain solutions. Crypto Users Divided Over Hoskinson's Ethereum Warning The crypto world responded swiftly to Hoskinson's statements. Some critics accused him of undermining Ethereum for competitive reasons. One user on X remarked: "The guy who copied Ethereum and made it worse is now predicting its death?" highlighting ongoing rivalry. Multiple users concurred with Hoskinson's assessment that Ethereum faced multiple challenges affecting its future infrastructure development. Users view these problems as evidence that Ethereum has stopped developing, while also being at risk of ongoing challenges. However, Ethereum (ETH) remained stable after falling by 0.38% to reach \$1,770 per token at the time of writing. Highlighted Crypto News Today: \$TRUMP Memecoin Jumps 70% as Gala Dinner with President Approaches

- As the price of Bitcoin and Ethereum increased, the crypto market faced a mass liquidation of over \$654.22 million. - Bitcoin saw liquidations totaling \$321.73 million as its price surged over 6%, crossing \$94,000 on April 23. The crypto market saw mass liquidations over the past 24 hours, totaling \$654.22 million. Around 172,659 traders were wiped out — mostly from short positions — highlighting growing pressure on bullish sentiment. The largest cryptocurrency, Bitcoin (BTC) liquidated \$321.73 million as its price gained more than 6% and went over \$94,000 on April 23. In the past 24 hours, around 7,023 BTC were bought and around 72,637 BTC were sold, as per the data from Cryptometer.io. The second position with the highest liquidation is captured by Ethereum, marking \$134.30 million. The price of Ethereum also rebounded today by skyrocketing 10% and hovering around \$1,700. In the last 4 hours as well as 24 hours, Bybit is accountable for the largest portion of liquidations, standing at \$14.77 million and \$267.45 million respectively. After Bybit, Binance holds the second position, having liquidated nearly \$131.59 million. Long-term Term Whales Cashing Out, Following The Recent Spike After the recent spike, long-term whales are cashing out their digital assets swiftly. The Blockchain Analytics Platform, Lookonchain, reported on X that a whale borrowed 15,000 ETH from Aave to sell and then withdrew all 35,754 ETH and then dumped it at an average price of \$1,794 in the last 3 hours. Another post of the platform mentioned that after the surge in the price of BTC, 2 wallets shorted BTC with 6x leverage at \$92,469.1 and \$92,664.8. Highlighted Crypto News Today: Binance Updates Crypto Transfer Rules in South Africa Amid Regulatory Push

- Ether price briefly touched the \$1,800 mark after recording over a 10% price surge. - Ethereum market dominance recovered from its all-time low as the token outperformed Bitcoin and the broader crypto market. - Ether whale accumulation is further boosting the Ether market price, as of April 23. Ethereum price surprised the entire crypto market after it briefly touched the \$1,800 mark earlier today. The broader crypto market reclaimed the \$3 trillion overall market cap, while Bitcoin recorded a 5.62% surge and climbed to the \$93k price level. However, the entire crypto community is having its eyes on Ether as it outperformed BTC after a long time. As the trade tension between the US and other countries eased and Trump announced that he has no intention to fire the Fed chair, the crypto market witnessed positive market sentiment. Meanwhile, the crypto fear and greed index recorded 52, which turned fear market sentiment into neutral today. Ethereum Price Records Over 10% Surge Before Hitting

\$1,800 Ethereum price surged by more than 10% today after the market sentiment improved in the crypto market. Ether is trading at \$1,795.87 at the time of reporting. It reached a 24-hour peak of \$1,816.52. Bitcoin also recorded a price surge of 5.9% and climbed to the \$93,600 price level. Major altcoins, such as XRP, Solana, BNB, Dogecoin, and Chainlink, have also recorded price gains today. This has resulted in a 6% increase in the overall market cap, close to \$3 trillion. There have been several times the crypto market showed recovery gains in the past few months after a short bull run in December 2024. However, Ether recorded average market performance every time, disappointing ETH long-term holders. With a price surge of more than 10%, Ether has outperformed most of the major altcoins and Bitcoin today. Ethereum market dominance started showing signs of recovery from its all-time low value. It hit an ATL of 7.07% a couple of days ago and increased by 1.67% today to 7.50%. Can Ethereum Whale Accumulation Further Push Its Market Price? ETH just hit \$1,800! " Lookonchain (@lookonchain) April 23, 2025 Whales continue to buy \$ETH. 0xD20E withdrew 5,531 \$ETH(\$9.8M) from #Binance in the past hour. 0x2088 spent 4.61M \$USDC to buy 2,568 \$ETH at \$1,794 in the past 40 minutes.<https://t.co/jzoEhDh2Fs><https://t.co/Gz3tdRjNWP> pic.twitter.com/Fow5pZZ0lM On-chain analytics platform Lookonchain reported Ethereum whale accumulation today. As the second-largest cryptocurrency by market cap recorded gains, ETH whales took this opportunity to increase their ETH holdings. Whale "0xD20E" withdrew 5,531 Ethereum from Binance. Another whale "0x2088" purchased 2,568 ETH at an average price of \$1,794. The increasing investor confidence in Ethereum might bring further gains for the token in the next few days. Its 73% surge in 24-hour trading volume also suggests the same. However, the broader crypto market must sustain its upward momentum for that to happen. And it is too early to say whether the crypto market is completely on track for the next bull run or will face pullbacks.

- ETH/BTC exchange rate falls to 0.01791, lowest since 2020. - Galaxy Digital, Paradigm, and Ethereum Foundation shuffle millions worth of ETH. - ETH's staking ratio at 28% lags behind competitors like Solana. The Ethereum market is facing mounting pressure as the ETH/BTC exchange rate has plummeted to its lowest level in nearly five years, according to recent TradingView data. The ratio has fallen to 0.01791, marking a significant decline in Ethereum's value relative to Bitcoin not seen since 2020. This downward trend coincides with increased selling activity from major institutional players and "whales" in the Ethereum ecosystem. According to blockchain expert OnchainDataNerd on X, Galaxy Digital sent an extra 5,000 ETH (about \$8.11 million) to Binance on April 22, 2025. Major firms reducing Ethereum exposure As previously revealed on April 18, 2025, Galaxy Digital moved about \$100 million worth of ETH to exchanges in a few days prior to this transaction. There are other significant companies lowering their exposure to Ethereum besides Galaxy Digital. Three hours before Galaxy's transaction, Paradigm sent Anchorage Digital 5,500 ETH, which is worth around \$8.65 million as per EmberCN. Furthermore, Lookonchain discovered that 1,000 ETH was sent to the Kraken exchange from an address connected to the Ethereum Foundation. These substantial movements from institutional holders are placing significant downward pressure on Ethereum's price at a time when the token is already struggling against Bitcoin's dominance. Currently, ETH is trading at \$1,574, representing a 2.5% decline over the past 24 hours, while Bitcoin approaches the \$90,000 mark. The widening performance gap between the two largest cryptocurrencies may prompt investors to shift their allocations toward Bitcoin, potentially intensifying the selling pressure on Ethereum. The Ethereum Foundation's history of multiple recent ETH sales further suggests that these large institutional transactions can significantly impact price volatility and impede Ethereum's growth trajectory. Beyond whale activity, ETH faces additional challenges that may be contributing to investor hesitation. The network's staking ratio currently stands at just 28%, substantially lower than competitors like Solana, which boasts a 65% staking ratio. This disparity, coupled with less attractive staking yields compared to alternatives, may be eroding investor confidence in ETH as a long-term holding. Bitcoin's market dominance has reached a four-year high, indicating capital is flowing away from Ethereum and other alternative cryptocurrencies. This trend could exacerbate ETH's relative underperformance if it continues. Despite these concerning short-term signals, some experts maintain optimism about Ethereum's long-term prospects.

- Ethereum's price has experienced a slight rebound from a downward trend, currently standing at \$1,625.79. - Technical analysis suggests Ethereum is nearing oversold conditions, potentially leading to a reversal. During Asian trading hours, Ethereum opened the market with a price value of \$1,576.53. At the timeframe, Ethereum has been recording a downward trend before experiencing a slight increase, as the price now sits at \$1,625.79. Ethereum, the second largest digital asset by market capitalization has broken out of its dip that has stayed for months. The altcoin has been following a downward trend within a defined channel, making lower lows and lower highs. A deeper view indicates that this trend persisted for several months, but recent market movements indicate a possible reversal. The breakout occurred as ETH moved above the established trendline, suggesting the end of the downtrend. The attention from this breakout has addressed whether this means a short term trend reversal or pause in downward. To keep ETH's price action positive, it will have to remain above support and is likely to reject the down trend. ETH Technical Indicators Movement Revealed: Will the Bulls Take Over? MACD presents itself with a negative value of -100.65, which implies the present line of regression is going negative. When the MACD value is negative it only means that the bears have the key role in the market so chances are that the downside may not end. However, we need to see the bullish crossover reoccurring for us to use it as a signal to turn bullish. The histogram is smaller though, showing that the downward trend is declining too. On the other hand, the RSI, currently at 39.60, is approaching oversold territory, typically a signal that the asset may be undervalued and could potentially see a rebound if buying pressure increases. The RSI's value is close to 30, often seen as a buy signal. Despite the downtrend hint by MACD, RSI index claims a probable reversal as oversold condition nears. If the price continues to hold above the current level, an upward breakout might take place. Open Interest and Current Price Movement According to Coinglass data, open interest,

the metric that checks on a digital asset's futures, has recorded a uniform uptick. According to the market movement, there is a noticeable surge in open interest around April 2025, reaching \$18.26 billion as of press. A look at Ethereum price on CoinMarketCap indicates that the price value in the market is \$1,625.79 reporting a dip of 1% in 24 hours. Additionally, the trading volume at the same period read at \$15.35 billion noting a 30.76% uptick. Ethereum's market cap stood at \$194.74 billion, with a circulating supply of 120.71 million ETH. The data illustrates price fluctuations within a short period and an increase in trading volume, indicating significant market activity for Ethereum.

- Zora NFT platform will launch native ZORA tokens this week on April 23. - The token launch takes place on the Base network even though Zora works on the Ethereum blockchain. Even though Ethereum is gradually losing its spark, projects that operate on it are working tirelessly to improve their offerings. NFT platform Zora has announced that it is going to launch its native token this week on April 23. This is a remarkable step for the Ethereum-based platform to transition into an on-chain social network. The official X account of Zora made this announcement earlier today. Two snapshots will include its token launch activity from January 2020 to April 2025. Even though the NFT platform works based on the Ethereum network, it chose Coinbase's Base blockchain for its token launch. Base blockchain proved its credibility and reliability in the last few months and witnessed an increase in on-chain activity. This not only increases token accessibility but also attracts a wider audience. Leading crypto exchange Binance announced that its users can access ZORA tokens on Binance Alpha from April 23, 2025. Eligible users will receive 4,276 ZORA tokens into their Binance Alpha account. To be eligible for this, users must have purchased at least \$50 on Binance Alpha in the last 30 days. Zora Platform Allocates 10% Supply to Token Launch The NFT platform detailed its token distribution in its earlier announcement in March. - 10% of the supply will reach users' wallet addresses in the upcoming token launch - Future community incentives will get 20% of the supply - Zora treasury includes another 20% of tokens, which will be unlocked in the next four years. - 5% of the total supply will take care of ZORA's liquidity - Team members receive 18.9% of tokens - Project contributors receive 26.1% of tokens The Zora platform made it clear that its token is only for community use. Unlike other native crypto tokens, ZORA will not provide any governance rights to its holders. However, the token launch is a major milestone for the platform and growth in the coming years. Highlighted Crypto News Today: Bybit Hack Update: Hackers Use Crypto Mixers to Launder Stolen Funds

- PlanB made a post in which it mentioned that Ethereum (ETH) is eligible on all outlooks to be a "real shitcoin." - This comes after Vitalik Buterin's June 2022 post on X, where he criticized the stock-to-flow model, saying it was "really not looking good now." Nearly after three years, PlanB, a Dutch institutional investor and Bitcoin analyst renowned for the Stock-to-Flow model, has recently slammed Ethereum (ETH), calling it a "centralized, premined shitcoin." On April 20, PlanB posted on X (formerly Twitter), mentioning that "Ethereum is really not looking good now." The post further called Ethereum a "shitcoin" and asserted that it is "centralized and premined." He further added that Ethereum is harmful and deserving of all the mockery they get. Ethereum is really not looking good now" PlanB (@100trillionUSD) April 20, 2025 I know it's impolite to gloat and all that, but I think shitcoins like ETH, that are centralized & premined, have PoS instead of PoW, switch supply schedule at will, are harmful and deserve all the mockery they get <https://t.co/4EAh8LvsVD> pic.twitter.com/nLTlQJz4wp Three years ago, Vitalik Buterin, the co-founder of Ethereum, slammed the anonymous analyst behind Bitcoin's Stock-to-Flow model of PlanB, which tries to speculate the price of BTC based on the ratio between its current supply and the rate of fresh issuance through mining. Since then, PlanB remained silent on the matter and chose to speak yesterday after three years. The Conflict of Wills In June 2022, Buterin posted on X (then Twitter) that Stock-to-flow is really not looking good now. And, this time, the analyst replied in the same manner. Further, the co-founder mentioned in his post that he knows that it is rude to relish and all that, but in his view, the financial models that give people a false sense of positivity and fate that number-will-go-up are harmful and are worthy of all the mockery they get. This statement was a jab that came after the price of BTC was parting sharply from the predictions made by the S2F model. Now, it looks like PlanB is doing the same when Ethereum is facing low price actions. PlanB made another post in which it mentioned that ETH is eligible on all outlooks to be a "real shitcoin." Also, "ETH does not have a fixed supply schedule" as well as "a monetary policy." Adding more to this, PlanB mentions that ETH has never surpassed BTC. He also highlighted that the token distribution model of Ethereum is an issue, mentioning that the dumping from the Ethereum Foundation is "attached to the premine," which is a big red flag. Highlighted crypto news today: Dogecoin Breaks Out of Descending Triangle Pattern as Bulls Hint Take Over

- Top cryptos to watch this week: Ethereum, XRP, and Solana, which are showing early signs of recovery after recent dips. - ETH trades near \$1,640; Vitalik Buterin proposes replacing EVM with RISC-V to improve speed and reduce costs. After three rough weeks of downward pressure, the crypto market is finally showing signs of recovery. Bitcoin, which had dropped below \$74.5K earlier this month, is now trading above \$87K "bringing a wave of positivity across major altcoins as well. The overall sentiment has shifted from panic to cautious optimism as investor confidence returns. Still the fear and greed index stands at 34, indicating "Fear." This week, all eyes are on Ethereum (ETH), XRP, and Solana (SOL) "three of the top performing coins from the past, as they are expected to recover in this market rebound. Ethereum (ETH) Ethereum has bounced back strongly, currently hovering near the \$1,640 zone. Last week, ETH dipped close to \$1,415 due to profit-booking and macroeconomic uncertainty. But now with broader market strength and optimism around the upcoming changes could have a profound impact on ETH's price. Ethereum's co-founder Vitalik Buterin recently proposed a significant update to Ethereum's infrastructure, replacing the current Ethereum Virtual Machine

(EVM) with RISC-V, an open-source instruction set architecture. This change is expected to boost Ethereum's speed and reduce transaction costs, making it more scalable and user-friendly for developers. This move is in line with Ethereum's broader strategy to enhance its network's efficiency and lay the groundwork for future upgrades. Ethereum is trading at \$1,639.54 with immediate resistance near \$1,650. A breakthrough above this could push the price towards the next resistance at \$1,700. On the downside, the immediate support lies at \$1,570, followed by a stronger support around \$1,500 if the price faces further pressure. Ripple's XRP has also made a solid comeback, gaining around 7% in the past few days. Over the past few weeks, it struggled under \$2. Currently priced at \$2.12, XRP has seen a 1.44% uptick, buoyed by Ripple Labs securing a payments license in the UAE and nearing the conclusion of its long-standing legal battle with the U.S. SEC. The weekly chart reveals a bull flag pattern with a breakout target of \$5 if the price can breach the upper boundary of the flag at \$2.50. Solana (SOL) Solana is back in the spotlight, climbing from its recent low of \$96 to above \$140. Over the past week, the price of SOL surged by over 6.35% and 8.50% over the month. The drop in Solana's price was significantly impacted by the loss of meme coins like TRUMP Coin and FARTCOIN. However, the current SOL price stands at \$141.14 with the daily trading volume soaring by over 55.75% to \$3.42 billion. If the positive momentum continues to build, the next resistance level is at \$150 followed by a significant resistance at \$170, which has been identified as a crucial level for any bullish scenario. The immediate support level is at \$135 with a stronger support zone around \$125-\$127. The forecast was driven by the launch of spot Solana ETFs on the Toronto Stock Exchange (TSX). These ETFs are backed by direct SOL holdings and feature staking, a first for any publicly listed Solana product. However, while Canada moves forward, the U.S. Securities and Exchange Commission (SEC) has yet to approve any Solana-based ETFs. Despite this, seven major U.S. asset managers, including Fidelity, VanEck, Franklin Templeton, and Grayscale, have filed to launch their own Solana ETFs, sparking market speculation. Why the Market is Volatile The recent volatility can be traced to several global triggers that include inflation worries, shifting interest rate expectations and the U.S. Fed's mixed signals. On-chain activity is rising again, but traders are still reacting cautiously to news cycles and macro events. For now, Ethereum, XRP and Solana are looking strong and trying to lead the way as the market attempts a full recovery. Highlighted Crypto News for Today

- Ethereum is hovering in the \$1.6K price range. - The trading volume jumped by over 78%. The brief uptick in the crypto market cap has reached \$2.75 trillion. The largest asset, Bitcoin (BTC), trades closer to \$87.4K, while the largest altcoin, Ethereum (ETH), is trading within the bearish zone, and the asset couldn't escape from the hold. ETH has formed a bearish trend line, and after multiple recovery efforts, the asset remains in the negative shade. A recovery wave above \$2K has the potential to initiate an upside correction. Following a 1.59% spike, ETH is trading on the edge. The altcoin opened the day trading at around a bottom level of \$1,566. The modest bullish pressure triggered the asset to climb to a high of \$1,643. As of now, Ethereum traded at \$1,638, with the daily trading volume staying at \$11.18 billion. In addition, the market has observed a liquidation of \$34.73 million worth of Ethereum as per Coinglass data. The on-chain data revealed that a large whale just pulled out 1,897 ETH, worth around \$3 million, from Bitget. Notably, the whale has withdrawn 3,844 ETH valued at \$6.51 million over the past few weeks. Can Ethereum Hold Its Ground or Is More Loss Ahead? The Moving Average Convergence Divergence (MACD) line of the ETH/USDT trading pair has crossed over the zero line, indicating the early stage of a bullish start. Whereas the signal line remains zero, it confirms that the overall trend is not strong. ETH's Chaikin Money Flow (CMF) indicator, stationed at -0.03, suggests that capital is flowing out of the asset, inviting weakness in momentum. Meanwhile, the daily trading volume of the asset has increased by over 78.47%. The brief wake of bulls has not strengthened, which might signal the dominance of the bears. Assuming the continuation of downside correction, ETH could fall and test the \$1,580 support. Emerging death cross may open the door wider for plummeting to \$1.5K. If the altcoin rebounds, it will likely break above the \$1,688 level. With this momentum, Ethereum could push past \$1.7K, bringing the \$1,836 target within reach. An extended uptrend might form a golden cross, making the recovery fast and sustainable. Moreover, the Bull Bear Power (BBP) reading of 64.36 signals a strong bullish momentum in the market. Besides, Ethereum's daily relative strength index (RSI) staying at 63.89, implies that the asset is in positive territory.

- Buterin suggested swapping out the present Ethereum Virtual Machine (EVM) contract language. - The idea brings attention to Ethereum's ongoing battle to enhance throughput while staying competitive. To make the Ethereum network's execution layer faster and more efficient, Vitalik Buterin, a co-founder of Ethereum, has suggested swapping out the present Ethereum Virtual Machine (EVM) contract language for the RISC-V instruction set architecture. Buterin listed zero-knowledge EVM proving, reliable data availability sampling, and maintaining competitive block creation as long-term obstacles to growing the Ethereum network in his proposal from April 20. Staying Competitive Implementing the RISC-V architecture in smart contracts, according to the Ethereum co-founder, would make zero knowledge functions for the execution layer more efficient. And maintain competitiveness in the block production markets. As investors begin to lose faith in the original smart contract blockchain, the idea brings attention to Ethereum's ongoing battle. To enhance throughput while staying competitive with next-generation monolithic blockchains like Sui and Solana. Based on statistics from Etherscan, the blob fees for Ethereum, which are transaction fees extracted from Ethereum layer-2 scaling networks, hit a new weekly low of 3.18 Ether for the week ending March 30. Blob fees received throughout the time were 3.18 ETH, which, at the current price of Ether, is almost \$5,000. Ethereum network costs were around \$0.16 per transaction in April 2025, its lowest level since 2020. As per industry experts, the steep drop in costs is because fewer people are using the Ethereum base layer to make transactions. Instead, they are turning to smart contracts or one of Ethereum's several layer-2 scaling solutions. The layer-2 networks of Ethereum have been characterized as both a boon and a bane. Since they have reduced base layer transaction costs significantly while also eating into base layer revenue. Revive?

ETH and ADA tokens traded near the single cent mark during the year 2017. The value of ETH grew and topped \$4,000 while ADA reached more than \$3 throughout a few short years. Current cryptocurrency market participants seek outstanding potential tokens after failing to participate in the past explosive growth phases. Rexas Finance (RXS) has established itself as a superior token investment for the upcoming two-year period leading up to the 2025 bull market. Rexas Finance (RXS): The Next Big Crypto Opportunity The blockchain network receives revolutionary changes from Rexas Finance through its tokenization process of genuine assets, including real estate and commodities, along with fine art. The real-world functional value of RXS distinguishes it from meme coins and speculative tokens because it makes the currency a better match for enduring success. Rexas Finance takes the lead in the growing RWA market, which currently exceeds \$30 trillion in value. The RXS presale reached 566% growth during its initial price of \$0.03 up to \$0.20 in its final selling stage. Substantial investor trust has developed because RXS raised more than \$47 million by selling 455 million tokens. RXS will start trading officially at \$0.25 on June 19, 2025, thus providing a 25% profit increase for early investors. Major exchange listings have been verified to make sure there is a secure exchange system which enables broader acceptance by investors. Why RXS Could Deliver Ethereum-Like Gains High-utility projects such as ETH and ADA gave early investors remarkable exponential value growth when they first entered the market. A consensus among experts shows RXS market value can surpass \$12 by 2025, resulting in an exceptional 5,900% price growth and professional analysts believe the asset will exceed \$100 when the next bull market emerges. Several influential factors behind this substantial growth projection have made RXS tokens attractive to investors. The RWA market surge has drawn institutions and retail investors to use blockchain technology for asset tokenization which intensifies the RXS token market demand. The strong investor enthusiasm for the project is evident, as RXS tokens were quickly snapped up from the market during the presale phase. Additionally, the Certik Security Audit provides serious investors with the trust and security needed to participate in the ecosystem. The market position of RXS will strengthen following massive listing decisions made by cryptocurrency exchanges after the launch. Conclusion Ethereum and Cardano investors who purchased tokens in 2017 achieved the most successful entry point before their explosive market growth. RXS demonstrates a single-time investment chance just like Ethereum and Cardano offered in 2025. RXS demonstrates all the right elements needed for success so it stands to become the next cryptocurrency that will turn minimal investments into giant wealth accumulation opportunities. - Website: <https://rexas.com> - Whitepaper: <https://rexas.com/rexas-whitepaper.pdf> - Twitter/X: <https://x.com/rexasfinance> - Telegram: <https://t.me/rexasfinance> Disclaimer: TheNewsCrypto does not endorse any content on this page. The content depicted in this Press Release does not represent any investment advice. TheNewsCrypto recommends our readers to make decisions based on their own research. Ethereum futures saw \$42.43 million in liquidations, but rising investor focus has shifted towards Rexas Finance's surging presale performance. The ERC-20 token RXS, built around tokenizing real-world assets, has gained massive traction, leading to record accumulation. Ethereum is holding steady, yet the real market excitement stems from Rexas Finance's explosive growth and rising community trust. Rexas Finance (RXS) Presale Performance and Market Excitement Rexas Finance continues to dominate the spotlight, with over 91% of its presale allocation sold and \$47 million raised. The token, currently priced at \$0.20, has risen over six times from its launch presale price of \$0.03. It is now entering its final stage ahead of the confirmed exchange listing price of \$0.25 on June 19, 2025. Investors are showing significant interest due to RXS's real-world utility, which makes it more than a speculative digital asset. The token enables fractionalized ownership of real estate, commodities, and art through blockchain, attracting institutional attention. As more investors seek long-term crypto projects, RXS presents both growth and sustainability potential. Its strong presale performance reflects rising confidence, and many expect substantial price action post-launch. Unlike volatile meme coins, Rexas has established itself as a practical solution for real-world asset tokenization. This foundation supports a bullish outlook and enhances its long-term market prospects. Community Engagement and Trust in Rexas Finance (RXS) Rexas Finance has emphasized security and transparency, leading to a full Certik audit to assure investor confidence. With a verified contract and smart contract security, RXS is gaining attention for being a secure and scalable project. Investors value trust, and Rexas Finance has built its infrastructure around reliable blockchain compliance. Rexas Finance continues to set itself apart through practical application and robust investor confidence. These factors and rising institutional interest support its position as a standout crypto initiative. Its steady rise shows that RXS is widely adopted and seen as a trusted ERC-20 token. Ethereum (ETH) Faces Resistance, But Long-Term Outlook Holds Potential Ethereum surpassed the \$2,069 resistance threshold for the initial time in twelve days to indicate temporary appreciation in market value. Technical indicators present mixed signals because both the RSI stays below neutral and the Stochastic Oscillator approaches its overbought position. The failure of \$2,069 to remain in place could result in a decline toward \$1,818 and possibly more. The existing bullish setup could become invalidated if Ethereum falls daily below \$1,800, potentially leading to a price descent toward \$1,500. ETH will have the ability to move toward \$2,267 if it successfully defends its current position at \$2,069 and obtains renewed upward momentum. For Ethereum to achieve a sustained price increase through a breakout, the cryptocurrency needs to retain affirmative market sentiment. Ethereum's implementation process proceeds slower than RXS's because its success depends on technical factors and market pricing dynamics. Ethereum's popularity stays high, but its trend lacks the current enthusiasm to strengthen upcoming assets such as Rexas Finance. Multiple investors choose tokens such as RXS because they present an improved set of short-term drivers for market growth. Rexas Finance (RXS) Holds Long-Term Potential While Ethereum continues its battle against resistance, Rexas

Finance enjoys a surge in accumulation and growing investor demand. Its market relevance is expanding, fueled by the \$30 trillion real-world asset market tokenization. RXS combines blockchain innovation with real-world application, offering a transformative value proposition. The successful presale, secure audit, and community rewards program position Rexas Finance for exceptional post-launch performance. RXS is becoming a standout candidate for 2025 price appreciation as investors seek future-defining projects. With rising institutional attention and public interest, Rexas Finance could be a wealth-building opportunity in the evolving crypto market. RXS provides a solid foundation and positions itself as a reliable and scalable token for the future. With its ongoing momentum and real-world use, Rexas Finance is expected to remain in the spotlight beyond its exchange debut. It is one of the most promising ERC-20 tokens to watch in 2025. - Website: <https://rexas.com> - Whitepaper: <https://rexas.com/rexas-whitepaper.pdf> - Twitter/X: <https://x.com/rexasfinance> - Telegram: <https://t.me/rexasfinance> Disclaimer: TheNewsCrypto does not endorse any content on this page. The content depicted in this Press Release does not represent any investment advice. TheNewsCrypto recommends our readers to make decisions based on their own research. With fresh initiatives challenging the hegemony of existing giants like Ethereum (ETH) and Binance Coin (BNB), the cryptocurrency market has always been a hive of invention. With Ethereum's innovative, brilliant contract architecture and Binance Coin's exchange-driven utility, these tokens helped usher in a transforming period in blockchain technology in 2017. By 2025, a new pair—Rexas Finance (RXS) and VeChain (VET)—priced at \$0.20 and \$0.25, respectively, is becoming more and more popular as possible successors ready to change the crypto scene with their original value propositions and practical uses. Rexas Finance (RXS): Revolutionizing Asset Ownership Leading innovator in the tokenization of real-world assets, a field bridging conventional finance with blockchain technology, Rexas Finance is causing waves. At just \$0.20, Rexas Finance provides investors with a reasonable starting point into a project with phenomenal expansion capacity. While Ethereum in 2017 concentrated on allowing distributed apps, Rexas Finance targeted the trillion-dollar markets of real estate, commodities, and other tangible assets. Rexas Finance releases liquidity and internationally democratizes investing possibilities by letting users tokenize and exchange fractional ownership of formerly illiquid assets. Rexas Finance appeals because of its strong ecosystem, which features Launchpad for new blockchain companies, Token Builder to create custom tokens, and Rexas Estate for property investment. Rexas Finance has shown excellent demand since its presale, generating millions and almost matching listings on leading exchanges at an anticipated \$0.25. With 91.70% of the tokens already bought, the last presale stage is fast running low on supply. Investors seeking RXS at the presale price of \$0.20 have limited time before the chance expires as availability gets tight. Analysts are optimistic; some estimate RXS might rise to \$5 or above inside. With a Certik audit guaranteeing security and listings on CoinMarketCap and CoinGecko improving visibility, Rexas Finance reflects the early promise of Ethereum but with an eye toward actual, physical value. VeChain (VET): Supply Chain Mastery Another competitor taking the front stage is VeChain, which trades at \$0.25 as of this writing. While BNB uses a centralized exchange, VeChain stands out, emphasizing corporate-quality supply chain solutions. Designed to improve openness and efficiency, VET drives a blockchain platform tracking products from manufacture to delivery, supporting food safety, luxury goods, and logistics sectors. Unlike BNB's early exchange-centric approach, partnerships with big companies like Walmart China and BMW highlight its actual uptake. With VeChain's dual-token system—VET for transactions and VTHO for gas fees—stability and scalability are provided, addressing some of Ethereum's early problems, including high gas prices. For investors looking for long-term development, VET is still inexpensive at \$0.25 compared to its use and expanding ecosystem. VeChain's potential to explode resides in its capacity to grab enterprise demand, just as BNB capitalized on trading volume; its market cap is still tiny compared to ETH and BNB in their prime. Analysts see VET as a sleeper hit; forecasts point to it perhaps reaching \$1 or more as adoption picks up steam. Ethereum and Binance Coin flourished on speculation and fundamental innovation in 2017, with ETH as the backbone of distributed apps and BNB as a utility token for a growing exchange. Rexas Finance and VeChain now provide something more specific: valuable ideas. While VET simplifies worldwide supply chains, Rexas Finance addresses the inefficiencies of asset ownership, accessing markets significantly larger than those of the crypto-native ecosystems of 2017. Their cheap entry rates—\$0.20 for RXS and \$0.25 for VET—echo the affordability that brought first investors to ETH and BNB, but with less dependence on excitement and more on functionality. This pair offers a unique chance for investors who missed the 2017 surge to enter early on projects with the potential to replicate—or even exceed—the explosive increases of ETH and BNB. Conclusion Rexas Finance and VeChain are computed plays on the future of blockchain technology, not only speculative investments. Like Ethereum and Binance Coin in their infancy, RXS and VET mix affordability with innovative use at \$0.20 and \$0.25. This new team is ready to lead the charge as the crypto market develops outside of the speculative frenzy of 2017, providing investors with an opportunity to profit from the next significant step in digital finance. Whether RXS reaches \$5 or VET rises to \$1, their paths point to them redefining what it means to be a crypto powerhouse in 2025 and beyond. For more information about Rexas Finance (RXS) visit the links below: - Website: <https://rexas.com> - Win \$1 Million Giveaway: <https://bit.ly/Rexas1M> - Whitepaper: <https://rexas.com/rexas-whitepaper.pdf> - Twitter/X: <https://x.com/rexasfinance> - Telegram: <https://t.me/rexasfinance> Disclaimer: TheNewsCrypto does not endorse any content on this page. TheNewsCrypto is not accountable for any damage or loss related to content, products, or services stated in this Press Release.

- Ethereum holds steady near \$1.5K. - The market has witnessed ETH liquidations worth \$17.69 million. Crypto assets remain trapped in the fear zone, with mixed signals across the market, triggering an uncertain price trajectory. The largest altcoin, Ethereum (ETH), continues to be held down by bearish

pressure, slipping by 0.30%. The bearish territory established by Ethereum seems impossible to escape. An upturn could reinforce once the altcoin breaks above \$2K. ETH opened the day trading at \$1,564. The brief wave of bulls has pushed the asset to \$1,615, and it has failed to hold the range, slipping down. At press time, Ethereum traded within the \$1,590 range, with its market cap reaching \$191 billion. The daily trading volume has touched \$10.86 billion. Notably, the market observed a liquidation of \$17.69 million worth of Ethereum during this period. Furthermore, as per on-chain data, a whale recently bought 10,328 Ethereum for \$16.37 million at \$1,585 each. It generally reflects market confidence. Is Ethereum Stuck in a Downtrend? Ethereum might retrace to the nearby support at the \$1,512 range if the bears persist. A death cross could emerge with the failure to hold this trading level, driving the way toward a sharp decline to \$1.5K. Anticipating a recovery, the altcoin could climb to the range of \$1,614. A steady upside correction might send Ethereum to the potent \$1,640 resistance. This move will potentially drive a sustained uptrend. The ETH/USDT trading pair's Moving Average Convergence Divergence (MACD) line and the signal line have crossed below the zero line. This crossover implies a negative sentiment and the altcoin's further drop. In addition, the Chaikin Money Flow (CMF) indicator stationed at -0.13 signals that the capital is flowing out of the asset. Meanwhile, the daily trading volume of Ethereum has decreased by over 22.98%. ETH's daily relative strength index (RSI), found at 46.85, suggests the neutral condition, neither overbought nor oversold. Moreover, the Bull Bear Power (BBP) value resting at -3.03 indicates weakness. Disclaimer: The opinion expressed in this article is solely the author's. It does not represent any investment advice. - Hong Kong's SFC approves staking-enabled Ethereum ETFs, boosting regulated crypto investment. - ChinaAMC and OSL's Ether ETF lets investors earn staking rewards passively. - Part of Hong Kong's ASPIRe roadmap to lead Asia's digital asset ecosystem. Hong Kong is making itself as Asia's digital asset hub. The Securities and Futures Commission (SFC) has greenlit staking services, allowing China Asset Management (ChinaAMC) to launch an Ethereum ETF with staking by May 15. This is a significant move towards institutional crypto investment being made more compliant and accessible. The ETF is constructed in partnership with OSL Digital Securities. The first SFC-licensed and SFC-insured digital asset trading platform in Hong Kong crypto. OSL will provide the custody service through insured cold storage, and Ethereum validator nodes will be run by staking infrastructure company Kiln. The partnership provides for a clear division of roles OSL handles asset security and the redistribution of rewards, while Kiln oversees validation. [This] lowers the barrier to entry for Ethereum staking, said ChinaAMC Head of Digital Assets Thomas Zhu. Investors will benefit through staking rewards integrated into the ETF's net asset value, turning passive holdings into yielding assets. This follows the footsteps of Bosera International and HashKey Capital, which are also launching their own staking-enabled fund on April 25. These are some of the steps part of a broader movement that has been prompted by Hong Kong's new ASPIRe roadmap. To build a strong virtual asset ecosystem focused on Access, Safeguards, Products, Infrastructure, and Relationships. The ETF provides investors an easy, safe means of entering Ethereum staking without the technological complexity. While returns will be marginally lowered due to costs. The product improves liquidity and makes tax reporting easier "best for mainstream investors entering crypto. Hong Kong's forward-thinking approach to regulation betrays its intentions to be a leader in digital asset innovation. And, by example, may dictate a similar response from other international financial centers worldwide, promoting wholesome crypto growth.

- Ethereum fees dropped to a five-year low of \$0.168, as of April 2025. - The ETH market price is trading in the \$1,590 price range with no significant gains for the past few months. The Ethereum blockchain has been gradually losing its spark for the past few months with reduced on-chain activity. It was once the top blockchain network for all decentralized activities, such as dApps, DeFi, NFTs, etc. But it continues to lose ground to other sophisticated blockchain networks with more use cases. Blockchain analytics platform Santiment recently published a report on the significant reduction of Ethereum fees. It highlighted that the average cost of a transaction has dropped to a 5-year low of \$0.168. The last time it recorded a transaction fee below \$0.17 was in May 2020. This demonstrates a substantial reduction in the usage of the Ethereum blockchain. Users who spend ETH and make various kinds of transfers on the Ethereum blockchain are decreasing. When network traffic increases, users bid high transaction fees for their transaction execution. Since there is no network congestion, users do not need to pay high fees, which is the reason why the fees are lower at present. Ethereum (ETH) Price Trades Above \$1,500 Price Level Ether is trading at \$1,598.72 with no significant gains or losses at the time of reporting. It is recording weekly and monthly price changes of -0.24% and -15.54%, respectively. Along with the Ether market price, its market capitalization value has also dropped significantly to \$192.93 billion from its all-time high value of \$559 billion. The decreased usage of the Ethereum blockchain and the ETH market price have one thing in common which is reduced usage. The Santiment report also highlighted that the decreased fee level under \$1 is a sign that the community has become disinterested in the blockchain. Ethereum has been facing issues not only in terms of market prices and fees but also in terms of developer activity. When the crypto market was on a short bull run by the end of 2024, several altcoins recorded ATH values except Ether. It has disappointed its community and is still continuing its dull performance, fueled by the global macroeconomic uncertainty. Highlighted Crypto News Today: Bhutan Turns to Sustainable Crypto and Bitcoin Mining to Strengthen Economy

- Ethereum maintains upward momentum, reaching \$1,610, with key support near \$1,427 and a target of \$1,931. - Galaxy Digital deposits 49,681 ETH, signaling potential market shifts and influencing Ethereum's behavior. Ethereum's price has been on the rise, valued at \$1,601. Within the last 24 hours, Ethereum recorded nearly a 2% growth that demonstrates its capacity to resist market changes.

The market capitalization of Ethereum stands at \$193.28 billion, and the daily trading volume reaches \$14.26 billion. The value of the EHT for the day experienced movement between \$1,540.03 as its lowest point and \$1,610.78 as its highest point, which reflects market instability. According to analysis by CryptoQuant contributor abramchart, Ethereum is now trading near its realized price level of approximately \$1,585. This zone has historically been associated with price rebounds. The realized price level indicates deep-value accumulation phases, with past bull runs often beginning around or below this price. Ethereum is approaching the lower band (green), reflecting market cooling and creating an opportunity for accumulation. Market sentiment is likely to shift towards neutrality or bearish trend when Ethereum sustains downward trends that lead to prices reaching or falling below the realized price. Past data shows that such market conditions tend to occur before market bottoms, thus indicating that Ethereum may be headed toward a price rally if these indicators persist. In a noteworthy development, Galaxy Digital has deposited a substantial 49,681 ETH, valued at around \$79.37 million, into both Binance and Coinbase in the past five days. The deposits were executed through over-the-counter (OTC) swaps, according to data from Lookonchain. Galaxy Digital deposited 49,681 \$ETH(\$79.37M) into #Binance and #Coinbase in the past 5 days.<https://t.co/owM3zRHpAx> [pic.twitter.com/S12BGwsSCH](https://t.co/owM3zRHpAx) â€” Lookonchain (@lookonchain) April 17, 2025 The movement of such a large amount of Ethereum to major exchanges could be a sign of shifting market dynamics or trading strategies employed by Galaxy Digital. The influx of Ethereum into these exchanges is significant and could potentially impact Ethereum's market behavior shortly. Ethereum Technical Indicators Show Mixed Outlook at \$1,603 Ethereum's technical indicators show a mixed outlook. The current price of \$1,603 places Ethereum near the lower range of the 20-period Bollinger Bands, which could indicate a potential bounce upward. However, the MACD indicator shows a negative momentum, hinting a bearish pressure could continue. Also the histogram shows signs of weakening, indicating the momentum may be losing strength. Ethereum holds essential support at the price level of \$1,427 that matches with the lower border of its Bollinger Band. Recent testing of this level suggests moving towards bullish price action. An upward breakout from \$1,679 would strengthen bullish momentum by matching the position of the upper Bollinger Band. Ethereum looks set to rise towards \$1,931 once it remains above its price levels of \$1,427 and \$1,679. The next important price change requires continuous monitoring of price action between \$1,427 support and \$1,679 confirmation levels.

- Ethereum price drops amidst declining whale activity. - Number of millionaire ETH wallets hits the lowest level since 2023 of January. - Technical indicators suggest potential test of \$2,000 level. Ethereum has displayed resilience in recent trading sessions, climbing nearly 9% over the past week despite signs of waning interest from large investors. The second-largest cryptocurrency is currently trading around \$1,580, down more than 3% in the last 24 hours, as it tests a key descending resistance line. The recent price action has triggered significant market volatility. Data from Coinglass shows that roughly \$82.8 million in Ethereum trading positions were liquidated recently, with losses split between buyers (\$43.5 million) and sellers (\$39.2 million). The liquidations occurred amid heightened market volatility, coinciding with Bitcoin's rebound above the \$85,000 mark â€” a move that has provided a modest boost to overall market sentiment. Despite this uptick, Ethereum briefly fell to its lowest level since March 2023 last week. Although the recent pause in global tariff escalations has offered some short-term relief to the broader crypto market, it has yet to fully restore investor confidence. \$1 million holding Ethereum wallets drop Glassnode data indicates a notable trend: the number of Ethereum wallets holding at least \$1 million worth of ETH has declined in 2025, reaching its lowest point since January 2023. This change may reflect a shift in participation from high-value investors who often contribute to market stability. Supporting this, IntoTheBlock data shows a decrease in large transaction volume â€” a common indicator of whale activity â€” which has dropped from a peak of \$9.81 billion to \$2.75 billion. Recent on-chain movements align with this pattern, including a notable transaction on April 14, where a wallet moved 20,000 ETH (approximately \$32.4 million) to Kraken, possibly in preparation for a sale. Additionally, reports suggest that an early participant from Ethereum's 2015 ICO has been gradually reducing their holdings. On April 13, this wallet sold 632 ETH, worth around \$1 million, adding to the recent selling activity. Ethereum's open interest has also seen a minor pullback, declining 1.16% to approximately \$17.91 billion. This dip could affect the pace of any potential recovery in the near term. On the technical side, Ethereum has rebounded from the \$1,500 support level, indicating resistance from sellers at lower price points. Market participants are now watching the descending resistance line, with a break above it potentially reinforcing short-term bullish momentum.

- Ethereum has slipped over 3%, trading around \$1.5K. - ETH liquidations have surpassed \$49.85 million across the market. The bearish wave in the crypto market continues, with major assets taking a recent hit. Prolonged fear has led to mixed sentiment, and the largest altcoin, Ethereum (ETH), has posted a 3.74% loss. The bearish net that Ethereum weaved is enough to block the arrival of bulls. In the early hours, ETH was trading at a high range of \$1,659. Gradually, the potent bears have pulled back the price to the \$1,558 mark. At the time of writing, Ethereum traded at around \$1,580, with the daily trading volume resting at \$13 billion. Moreover, the market has observed a liquidation of \$49.85 million worth of Ethereum according to Coinglass. Notably, Galaxy Digital has transferred 12,500 ETH, worth around \$20.28 million, to Binance. Over the last four days, the firm has transferred a total of 37,500 ETH, valued at approximately \$60.4 million. Is It Time for Ethereum Bulls to Step In? If Ethereum's downside price trajectory continues, the price is likely to retrace to the range of \$1,567. The potent bears could further accelerate the loss, and the asset will see more correction toward \$1.4K or even lower. Assuming ETH bulls trigger an upside move, the price might reach \$1,621. Upon breaking, this level could act as support for the bulls and send the asset to the \$1,690 range. Also, it may potentially continue its recovery. The Moving Average Convergence Divergence (MACD) line is below the zero line, but the signal line is above it. This crossover indicates a mixed signal with a potential hesitation in the ETH market. In addition, the Chaikin Money Flow (CMF) indicator at -0.11

suggests that the capital is flowing out of the asset. Meanwhile, the daily trading volume of Ethereum has decreased by 13.86%. ETH's Bull Bear Power (BBP) value of -63.45 signals a sturdy bearish pressure within the market. Besides, the daily relative strength index (RSI) found at 42.52 implies a neutral to slightly bearish zone. Disclaimer: The opinion expressed in this article is solely the author's. - The notion that more openness is always a good thing, he said, is based on outdated assumptions. - Buterin anticipates that the need for privacy will only grow in tandem with the advancement of technology. Vitalik Buterin, co-founder of Ethereum, has cautioned that developers shouldn't put their faith in world politics' inherent openness and good intentions, and he has said that developers should prioritize user privacy. The importance of privacy in safeguarding individual freedom and countering the increasing influence of governments and businesses was emphasized by Buterin in a blog post dated April 14. The notion that more openness is always a good thing, he said, is based on outdated assumptions about people that are no longer true. The idea that world leaders are "generally well-intentioned and sane" and that society's cultural norms are improving are two examples of these assumptions. Buterin contended that both are becoming more and more false. Need for Privacy According to Buterin, hardly a single significant nation has a general consensus that the first assumption is correct. Also, according to an X post search for "bullying is good," societal tolerance is "rapidly regressing," as he put it in his writing. According to Buterin, there were moments when he felt uneasy due to his lack of privacy. He made it clear that "you never know when you will become one of them." Which may be seen as an indication that privacy is only beneficial for those who break the rules. With brain-computer connections offering the possibility of automated systems penetrating right into our minds. Buterin anticipates that the need for privacy will only grow in tandem with the advancement of technology. Automated price gouging is another problem; businesses charge customers whatever they think they can afford. The concept of incorporating government backdoors into privacy-protecting technology was likewise vehemently opposed by Buterin. Despite their prevalence, he warned, such jobs are precariously unstable. He emphasized that several corporate entities, with differing degrees of legitimacy, have access to private data. In the context of Know Your Customer records, in addition to the government. Instead, other parties like banks and payment processors store and process the data. Highlighted Crypto News Today: Vitalik Buterin Warns on EIP-7702 Risks Ahead of Ethereum's Pectra Launch

Ethereum's recent dip and XRP's sudden spike have kept investors alert "but another name is quickly rising above both: BlockDAG. With \$214 million secured in its presale and a newly launched 600% Golden Ticket bonus, BlockDAG is gaining momentum as one of 2025's most promising Layer 1 projects. As its highly anticipated 7th AMA approaches on April 17 and the team gears up for a global convention, the project's trajectory suggests this is more than a hype cycle "it's a well-structured move toward long-term relevance in crypto. Ethereum Retraces Below \$1,580 Amid Market Caution Ethereum is experiencing a short-term pullback, falling below \$1,580 despite showing strength earlier this year. The decline comes after a strong recovery from \$1,200 levels but now invites renewed concern from traders. Reports that World Liberty Financial (WLF) had sold large holdings added pressure "though WLF quickly denied those claims, stating: "World Liberty Financial has not engaged in any sale of ETH, and such reports are entirely false." Even with the clarification, the market responded with caution. Analysts now warn that Ethereum could revisit the \$1,400 range unless stronger support holds. While ETH's long-term outlook remains supported by development progress, its recent movement underscores the need for patience and perspective as broader macro factors influence short-term sentiment. XRP Jumps 12% as Adoption Metrics Point to Long-Term Growth While Ethereum pulls back, XRP is making a convincing move higher, jumping 12% on the back of strong network data. New on-chain metrics show a 490% increase in active XRP wallet addresses since 2022 "a sign that user activity is picking up at a fast pace. This surge is seen as a response to clearer regulatory signals and ongoing optimism about Ripple's progress in its SEC case. The boost in wallet count and on-chain volume has led some analysts to forecast potential price targets between \$0.90 and \$1.10 if sentiment remains positive. More than just a price spike, XRP's growth highlights renewed belief in real-world utility and scalable adoption. BlockDAG's 600% Bonus & \$214M Raise Signal a Strategic Leap Forward As other Layer 1s battle short-term volatility, BlockDAG is capturing long-term attention. With \$214 million raised through its presale and a fresh 600% Golden Ticket promo now live, the project is making a clear statement about where it's headed. Using code BDAG1200, new participants can access this limited-time offer and gain early entry into the project's next coin airdrop. The team describes this phase as a rare opportunity for new users to secure high-value rewards ahead of the platform's mainnet debut. The growing anticipation for BlockDAG's 7th AMA, scheduled for April 17, reflects how buyers are preparing for deeper insights and upcoming roadmap milestones. But BlockDAG's plans extend well beyond the digital sphere. The upcoming Global Convention aims to turn its online success into a real-world experience, giving community members early access to exclusive events in select cities. The project's leadership sees this as a pivotal step in merging community, transparency, and utility. With real adoption through the X1 Miner App, over 750,000 users, and more than 400,000 active Tap Miner players, BlockDAG is already ahead of most early-stage projects in terms of traction. These figures show it's not just about big numbers "it's about building a scalable, engaged network from the start. Ethereum's pullback and XRP's strong move underline the changing mood in the market. But as sentiment shifts, BlockDAG is staying focused on execution. The \$214 million presale, 600% Golden Ticket bonus, early airdrop access, and April 17 AMA reflect a strategy built on momentum, trust, and growth. As the Global Convention gears up, buyers are seeing more than just a token sale "they're witnessing the rise of a global crypto brand. With its hybrid consensus model and real-world expansion efforts, BlockDAG is stepping into a role few projects reach this early in their journey. Why BlockDAG Is Becoming the Layer 1 to Watch In a market filled with noise, BlockDAG is

offering something different—clarity, opportunity, and a clear vision for what comes next. Whether it's through gamified mining apps, its community-first structure, or its push into global events, the project continues to move with purpose. Ethereum still leads in development, and XRP is proving its staying power. But for those looking ahead to 2025 and beyond, BlockDAG may be the one building the strongest foundation today. Now, with the bonus still live, the AMA around the corner, and momentum building daily, this could be the right time to take a closer look at where BlockDAG is heading next. Ethereum (ETH) may have spent early 2025 in a sideways trend, but the winds are shifting rapidly. Institutions are returning, whale activity is increasing, and network domination is regaining traction. Over the next 60 days, three big drivers could propel ETH to unprecedented heights. **Ethereum Price Forecast: Three Catalysts for Growth** After a 50% drop in Q1, Ethereum is progressively recovering as it flips the \$1800 support. This is aided by strong fundamentals and increased institutional activity. Ethereum is trading around \$1820 as of press time, with the next critical resistance level at \$2,200. A move above this level could set the token up for a rally to \$4,000. While the general crypto market remains in the red, experts believe ETH can achieve this feat in the next 60 days, buoyed by several factors, including:

- 1. Whale Accumulation Is Surging** Ethereum whales have been accumulating tokens at a rapid pace. According to market researcher Crypto_Goos, ETH is undervalued compared to its ecosystem domination, pushing major holders to hoard ahead of a potential breakout. Over the last 45 days, addresses with more than 10,000 ETH added approximately 1.8 million coins to their balance sheets. Historically, this level of accumulation has frequently preceded multi-month rallies.
- 2. Ethereum Reclaims DEX Supremacy** In an unexpected twist, Ethereum has surpassed Solana in DEX volume for the first time since September 2024. This reflects its continued prominence in the DeFi space. Combined with Layer 2 scaling technologies such as Optimism and Arbitrum, Ethereum is beginning to solve its previous speed and gas price limitations. These changes are attracting many high-frequency traders and protocol developers back to Ethereum.
- 3. The Pectra Upgrade May Change the Game** The forthcoming Pectra upgrade is likely Ethereum's best short-term catalyst. Pectra's features, such as transaction batching, ERC-20 gas charge payments, sponsored transactions, and enhanced staking limits, have the potential to address various long-standing issues. Analysts anticipate a significant attitude shift once the mainnet is activated, which is expected to happen within 30 days. This might propel ETH beyond \$4,000 soon.

Amid this ETH's bullish storm, one new altcoin, **Rexas Finance (RXS)**, is also up for a revolutionary breakout. It targets a market debut on June 19. Here is why experts classify it as a potential biggest gainer in 2025.

Rexas Finance (RXS): The Under \$1 Altcoin Set to Explode Rexas Finance is opening up the real-world asset (RWA) market like never before. By converting historically illiquid assets like real estate, commodities, and fine art into blockchain-based tokens, Rexas Finance provides regular investors access to markets previously only available to institutions. Imagine buying a fraction of a \$5 million Manhattan house or a chunk of a gold deposit on your smartphone. Rexas Finance facilitates this. For example, a \$1 million office building can be tokenized into 1 million RXS-backed units, allowing investors to purchase them for as little as \$10. The result is instant liquidity, fractional ownership, and reduced barriers. What is the most impressive part? You do not require coding abilities. The Rexas Token Builder allows anyone to construct a tokenized asset in minutes. Its QuickMint Bot even supports fast deployment using Telegram or Discord, making token manufacturing as simple as sending a message. These technologies represent the foundation for a future in which tokenization becomes the norm for asset management.

RXS Presale: Nearly Sold Out with Over \$47.8M Raised RXS is currently in Stage 12, the final round of the public presale, with a price of \$0.20, up 566% from its \$0.03 launch. Over \$47.8 million has been raised, and over 459 million tokens have been sold. The final presale stage is 91% complete; over 50,000 holders have joined this movement. Importantly, Rexas Finance is a zero-VC project. No venture capital means no early unlocks, dumping, or market manipulation. Retail investors have complete power, which generates unparalleled grassroots enthusiasm. Can RXS 1000x? **Exchange Listing Could Be the Spark** The official RXS listing date is June 19, 2025, and the entry price is \$0.25 on at least three tier-1 exchanges. With exposure to global audiences and strong liquidity, this IPO might catalyze spectacular price activity. Furthermore, an ongoing \$1 million giveaway is increasing attention, and the top 20 contestants will receive \$50,000 in RXS apiece. With over 1.8 million entries, this campaign has increased investor participation and brand awareness before its market debut. With its institutional-grade infrastructure, rapidly rising user base, and exclusive access to RWA tokenization, Rexas Finance is poised to be one of 2025's most formidable gainers.

Conclusion: All Eyes on Ethereum, But Don't Sleep on Rexas Finance Ethereum's bullish momentum is increasing. With whale accumulation, reinvigorated DeFi leadership, and the Pectra upgrade on the horizon, ETH appears primed to provide big returns in the next 60 days. However, as Ethereum builds momentum, Rexas Finance provides exponential growth at a fraction of the cost. With its presale nearly sold out, tier-1 listings secured, and a game-changing use case in asset tokenization, RXS could be the biggest altcoin breakout of 2025. Do not wait. The last chance to buy RXS at presale prices is now. For more information about Rexas Finance (RXS) visit the links below: - Website: <https://rexas.com> - Win \$1 Million Giveaway: <https://bit.ly/Rexas1M> - Whitepaper: <https://rexas.com/rexas-whitepaper.pdf> - Twitter/X: <https://x.com/rexasfinance> - Telegram: <https://t.me/rexasfinance> Disclaimer: TheNewsCrypto does not endorse any content on this page. - Ethereum consolidates within a symmetrical triangle, suggesting potential for a breakout. - Whale activity increased, with 15,953 ETH moved to Aave, signaling positive market sentiment. Ethereum, the second digital asset by market cap is showing signs of consolidation within a symmetrical triangle pattern. As the pattern develops, a 17% uptick has been cast with the current market performance hinting early build up of the surge. ETH trades at a price value of \$1,679.41, noting a 3.84% surge in the last 24 hours. The market cap stands at \$202.68 billion and a 24-hour trading volume of \$16.56 billion, marking a 27.92% rise in volume Price Action Analysis and Breakout Levels to Watch Currently, Ethereum is in the phase of accelerating within the symmetrical triangle which can be estimated with converging trendlines. This makes the bullish formation more likely as the price range continues accommodating more consolidation. Analysts are paying attention to the support and resistance levels that will define the direction of the move. A deeper analysis prepared by Ali Charts indicates that, ETHs price has been fluctuating between \$1,580 and \$1,640, with key levels at \$1,600 and \$1,620. The price trend is moving within a narrowing range, indicating a potential for a breakout or breakdown. Fibonacci retracement levels are plotted, with the 0.618 level around \$1,600 acting as support. If Ethereum breaks above the upper boundary of the triangle, a move upward could follow, leading to substantial gains. Conversely, a drop below the lower boundary would signal a potential downturn in price. Whale Accumulation On Spree: Will This Activate More Uptrend? As Ethereum eyes the 17% surge, there is a renewed market activity. According to a Lookonchain post on X, a mysterious whale has moved 15,953 ETH worth \$26.16 million from the crypto exchange OKX into the decentralized finance protocol Aave. At the same time, it was notable that the same six wallets that made the transaction later acquired \$15.4 million in USDT against that ETH collateral and sent it back to OKX exchange. According to CoinMarketCap, Ethereum is currently priced at \$1,679.41, reflecting a 3.84% increase in the last 24 hours. The cryptocurrency's market cap stands at \$202.68 billion, with a 24-hour trading volume of \$16.56 billion, marking a 27.92% rise in volume. The circulating supply of Ethereum is 120.69 million ETH, matching the total supply. The price chart shows a rising trend as the gains extended. Ethereum dips and surges indicate an ongoing market action as the current trend supports a positive view aided by the volume and price rise. Highlighted News Today:

The latest market shake-up is turning heads as Ethereum (ETH) retraces gains while XRP posts a sharp 12% price jump. But amidst these contrasting moves, it's BlockDAG's presale momentum and upcoming milestones that are creating the biggest stir. With its \$214M raise and the just-announced 600% Golden Ticket bonus, BlockDAG is cementing its place as 2025's most talked-about Layer 1 project. Add in a looming 7th AMA on April 17 and the first-ever Global Convention, and it's clear: this isn't just a project riding the hype—it's a movement rewriting the rules of crypto growth. Ethereum Faces Pressure After Recent Spike Ethereum has come under pressure this week, shedding recent gains and trading below the key \$1,580 level. Despite bouncing back from its \$1,200 lows earlier this year, ETH continues to face uncertainty. One of the biggest narratives affecting sentiment was the rumor that World Liberty Financial (WLF) had dumped its holdings—rumors that WLF strongly denied. A spokesperson from the firm clarified, "World Liberty Financial has not engaged in any sale of ETH, and such reports are entirely false." Even so, the market reacted cautiously, and with macro concerns lingering, traders remain wary of a breakdown toward the \$1,400 zone. Analysts continue watching Ethereum's critical support levels, but for now, its price action is proving fragile in the face of renewed speculation and lackluster momentum. XRP Spikes 12% as Network Activity Explodes While Ethereum cooled off, XRP rallied sharply, rising over 12% this week as adoption metrics continued to climb. New on-chain data reveals that active XRP wallet addresses have surged 490% since 2022, marking one of the strongest growth periods for the network in recent years. The rebound follows recent optimism around regulatory clarity and progress in Ripple's long-running SEC battle. The increase in wallet activity comes alongside rising on-chain volume and a wave of small and mid-sized investors reentering the market. This uptrend in user participation has been seen as a leading indicator of future price strength, with some analysts calling for a push toward the \$0.90 to \$1.10 range in the coming weeks—provided bullish sentiment holds. XRP's fundamentals look promising, but it's the broader narrative around adoption that's really fueling the rally. BlockDAG's Golden Ticket Offer and Upcoming 7th AMA Create Historic Momentum While Ethereum and XRP jostle for investor attention, BlockDAG continues to carve out a different path—one powered by an explosive \$214 million presale and now a brand-new 600% bonus opportunity. Dubbed the Golden Ticket, this limited-time promo (activated via code BDAG1200) offers new participants a massive 6x bonus on all purchases made before the upcoming AMA on April 17. For early adopters, it's nothing short of a windfall. "This is your moment," reads the official message from the BlockDAG team. And they aren't exaggerating. Along with this offer, BlockDAG is offering early access to its upcoming airdrop—well before public distribution. It's a rare window for new investors to get preferential treatment before the platform's mainnet launch, and it's already fueling renewed hype across crypto circles. Beyond the bonus, the platform's leadership is leaning into transparency and community-building. The 7th AMA, scheduled for April 17, promises deep insights into roadmap execution, upcoming developer features, and further expansion news. If past AMAs are any indication, this one will drive another wave of presale traction. Just as attention peaks, BlockDAG has confirmed the upcoming launch of its first-ever Global Convention—a live event campaign set to roll out in select cities in the coming months. According to the latest announcement, anyone joining the ecosystem now will be among the first invited to this landmark experience. While details remain under wraps, BlockDAG has made it clear that the convention will serve as a bridge between the digital community and real-world engagement. By combining presale growth with real utility and in-person activations, BlockDAG is doing what few projects manage at this stage: converting momentum into a global brand movement. And it's working. Investor sentiment continues to surge as the platform pushes past each milestone on its journey toward mainnet and beyond. Final Word: This Market Is Listening—and BlockDAG Is Leading Ethereum's dip and XRP's breakout are just pieces of a much larger market narrative. With volatility high and opportunity peaking, projects like BlockDAG are setting the tone for 2025. The numbers speak for

themselvesâ€”\$214M raised, 600% Golden Ticket bonus live now, early airdrop access, and a 7th AMA days away. This isnâ€™t just momentum; itâ€™s controlled acceleration backed by real infrastructure. Investors seeking both upside and clarity in a crowded field of Layer 1s are taking notice. And with the Global Convention now announced, BlockDAG is building more than a productâ€”itâ€™s building a movement. Whether youâ€™re in for the tech, the bonus, or the long-term vision, now is the moment to pay attention. Join BlockDAG Presale Now: - Presale: <https://purchase.blockdag.network> - Website: <https://blockdag.network> - Telegram: <https://t.me/blockDAGnetworkOfficial> - Discord: <https://discord.gg/Q7BxghMVyu> Disclaimer: TheNewsCrypto does not endorse any content on this page. ETH and BTC rule the market right now as the largest cryptos. However, other cryptocurrencies have replicated their achievements over time. This year, five altcoins might replace Ethereum and Bitcoin. Their strong fundamentals and bullish momentum drive their ability to yield returns similar to ETH and BTCâ€™s. Among these, Rexas Finance (RXS) stands out due to its unique approach to real-world asset tokenization. Though a newcomer, experts think it could be among the best performers in this cycle. Rexas Finance (RXS) Rexas Finance is well-positioned to thrive in the real-world asset (RWA) tokenization sector, which is expected to grow to \$16 trillion by 2030. Rexas Finance turns physical assets like real estate and fine art into digital tokens. Through this tokenization process, Rexas Finance is unlocking investment opportunities that were once out of reach to regular investors. One of the biggest catalysts for RXS is its upcoming official token launch on June 19. The presale has already been a massive success, raising over \$47.5 million and selling 457 million tokens. With this level of demand before even hitting the broader market, analysts predict a major surge in value post-launch. RXS has already shown its potential, surging 566% since the presale began. This momentum shows strong investor confidence and highlights the massive upside still ahead. Demand is expected to skyrocket as the token lists on top-tier exchanges. Hence, explosive price growth could be seen in the coming months. Rexas Finance boasts a powerful ecosystem that sets it apart. The Rexas Token Builder is an easy-to-use tool for creating digital tokens. The QuickMint Bot allows users to create and deploy tokens quickly via Telegram and Discord. Meanwhile, the Rexas Estate is a dedicated platform for fractional real estate investments. Tokenomics is crucial in price sustainability, boosting Rexas Financeâ€™s long-term growth potential. Because of its limited supply, scarcity will naturally drive up the tokenâ€™s value. Rexas Financeâ€™s ecosystem and promising role in real-world asset tokenization give it an edge in the market. Institutional interest could rise, making RXS a top altcoin to buy, as RWA tokenization has been marked as one of the most promising sectors in crypto this year. Analysts believe RXS could reach \$10 quickly and eventually rocket about 100x within twelve months. If its presale momentum continues, RXS could deliver the predicted ROI. Ondo Finance (ONDO) Ondo Finance is making waves in the real-world asset (RWA) space. Recently, crypto whales bought 1.08 million ONDO tokens in just a week. This growing demand could push ONDOâ€™s price toward \$0.95, up from its current \$0.8. Ondoâ€™s tokenized treasury assets, OUSG and USDY, recently crossed \$1 billion. This milestone proves the strong appetite for RWAs in digital finance. With the tokenized Treasuries market hitting an all-time high of \$4.6 billion, Ondo is well-positioned for future growth. Its ability to bridge DeFi and traditional finance makes it a strong contender for investors seeking stability and yield. Uniswap (UNI) UNI is gaining significant attention from crypto whales, with large holdersâ€™ netflow surging over 3900% in a week. This signals strong accumulation. It has also reduced supply and could drive UNIâ€™s price higher. Riding the crypto market rebound, UNI recently broke key resistance levels. It surged over 8% to \$7.04. Indicators like MACD and Chaikin Money Flow suggest continued upward movement. Targets are at \$8 or higher. As demand for decentralized exchanges grows, Uniswap remains a top pick for investors eyeing long-term gains in DeFi. Hyperliquid (HYPE) HYPE has been recovering strongly, gaining 35% in just ten days after rebounding from \$12. Currently trading around \$16, itâ€™s eyeing the \$18.5-\$20 resistance zone. Technical indicators signal bullish momentum. For example, traders are growing confident as Open Interest surged by \$44 million. If HYPE breaks \$16.50, it could push toward \$19.16 and even \$21. However, a failure to clear resistance may send it back to \$13.44. With growing interest and improving market sentiment, Hyperliquid remains a solid investment this year. Tron (TRX) Tron is gaining traction as one of the most profitable blockchains, handling billions in Tether (USDT) transactions daily. Crypto analyst Javon Marks predicts a 516% price surge to \$1.11m. Founder Justin Sunâ€™s expansion of meme coins and planned integration with Solana further boost its appeal. With over 3 million active accounts and strong profitability, TRX is a top altcoin to buy. Conclusion Each of the five mentioned altcoins offers unique advantages that position them as the next Ethereum and Bitcoin. If the narrative sustains, they could be the best investment choices for the year. However, Rexas Finance stands out as the strongest contender. With an upcoming token launch and a rapidly expanding ecosystem, RXS has the potential for exponential growth. Following its presale momentum, analysts believe Rexas Finance is the best investment to make right now. For more information about Rexas Finance (RXS) visit the links below: - Website: <https://rexas.com> - Win \$1 Million Giveaway: <https://bit.ly/Rexas1M> - Whitepaper: <https://rexas.com/rexas-whitepaper.pdf> - Twitter/X: <https://x.com/rexasfinance> - Telegram: <https://t.me/rexasfinance> Disclaimer: TheNewsCrypto does not endorse any content on this page. As market watchers assess fresh waves of activity across top altcoins, Ethereum (ETH) and XRP are making headlines for very different reasonsâ€”one for technical positioning, the other for potential regulatory resolution. Ethereum is nearing a critical technical zone historically linked to market rebounds, while XRP edges closer to \$2 amid speculation of a settlement with the SEC. But as both

coins capture temporary attention, itâ€™s BlockDAG that continues to dominate long-term investor conversations. With its \$213.5 million presale still climbing, a 600% Golden Ticket bonus in effect, and its 7th AMA set for April 17th, BlockDAG is doing what few crypto projects can: turning every milestone into measurable momentum. As 2025 unfolds, this isnâ€™t just another presaleâ€”itâ€™s shaping up to be the most talked-about crypto project of the year. Ethereum Finds Crucial Support Near Key Technical Levels Ethereum (ETH) is currently drawing significant attention as it hovers near a historically important support zone. According to the latest analysis, Ethereum is approaching a technical confluence where its long-term trendlines and oversold indicators alignâ€”levels that, in previous cycles, have often preceded notable rebounds. While ETH has traded sideways in recent weeks, analysts believe that this area could mark a turning point. If buying pressure resumes, Ethereum could reclaim higher ground and re-enter a bullish phase. XRP Approaches \$2 as Regulatory Sentiment Shifts XRP has moved closer to the \$2 mark, riding on a wave of cautious optimism regarding a potential settlement between Ripple and the U.S. Securities and Exchange Commission (SEC). According to recent coverage, market observers are interpreting legal developments as signs that an agreement may soon be reached. This could bring an end to the multi-year lawsuit that has cast a shadow over XRP since 2020. With the regulatory fog lifting, XRP is beginning to attract more institutional and retail attention. The potential end to the SEC case would not only remove uncertainty but could also unlock new listings, integrations, and adoption channels. If the legal outcome proves favorable, many expect a strong price breakout above \$2, possibly setting the stage for a return to all-time highs. For now, XRP remains one of the most closely watched altcoins on the market. BlockDAGâ€™s \$213.5M Presale, 600% Bonus, and Upcoming AMA Define 2025â€™s Breakout Crypto As Ethereum and XRP capture headlines with market movement and regulatory speculation, BlockDAG is commanding a very different type of attentionâ€”one grounded in consistent execution and staggering growth. With \$213.5 million raised in under 10 months, BlockDAG now leads the 2025 presale leaderboard. This surge of interest has come with no backing from venture capital, signaling robust grassroots belief in what BlockDAG is building. And what itâ€™s building is unlike anything else in the Layer 1 space. At the core of the protocol is a hybrid DAG + Proof-of-Work architecture, allowing parallel block confirmations and dramatically enhanced scalability. According to CTO Jeremy Harkness during Keynote 3, â€œImagine if transactions didnâ€™t have to wait in a long queue, one after another. With our parallel processing, multiple blocks are confirmed simultaneously.â€ This approach positions BlockDAG to reach 15,000 transactions per second, shattering the constraints that hold back traditional blockchains. Investors joining now arenâ€™t just witnessing historyâ€”theyâ€™re benefiting from it. Through the Golden Ticket campaign, new users who enter with the code BDAG1200 are receiving a 600% bonus on their purchase, one of the most generous promotions ever seen in a top-performing crypto presale. These users will also gain early access to the coin airdrop, setting them ahead of the pack even before the token hits exchanges. Adding to the momentum, BlockDAGâ€™s 7th AMA is just around the corner on April 17th. This highly anticipated event is expected to dive deeper into the upcoming global convention, major partnership reveals, and mainnet progression. Based on previous AMA turnouts, this session could spark another wave of investor interest and presale acceleration. In terms of network security, the BlockDAG ecosystem is anchored in proven stability. The project has already passed security audits from Certik and Halborn, while investor and treasury funds are protected by institutional-grade Multi-Party Computation (MPC) systems. These measures are not just symbolicâ€”they are strategic, reflecting BlockDAGâ€™s goal to scale sustainably and securely. Mainnet is slated to go live later this year, with features that include full DeFi functionality, staking, governance tools, and listings on 10+ top exchanges. If the current trajectory holds, BlockDAG may not only enter the top 10 crypto rankingsâ€”it may define the class of tokens that lead the next market cycle. Final Thought: The Momentum Is Undeniable While Ethereum tests key support levels and XRP leans on regulatory developments for its next move, BlockDAG is advancing on all frontsâ€”technical, community, and financial. Its \$213.5M presale, real-world usage across hundreds of thousands of users, and a fast-approaching mainnet make it a compelling candidate for anyone seeking the top-performing crypto of 2025. For investors still sitting on the sidelines, now is the moment. With the 600% Golden Ticket bonus live, the next AMA approaching, and the convention countdown underway, BlockDAGâ€™s momentum is building fastâ€”and entry points like this donâ€™t last forever. - Presale: <https://purchase.blockdag.network> - Website: <https://blockdag.network> - Telegram: <https://t.me/blockDAGnetworkOfficial> - Discord: <https://discord.gg/Q7BxghMVyu> Disclaimer: TheNewsCrypto does not endorse any content on this page. TheNewsCrypto is not accountable for any damage or loss related to content, products, or services stated in this Press Release.

- Ethereum price crashed to \$2,000, its lowest in 16 months. - Whale liquidations and \$168M in ETH longs wiped out in 24 hours. - If \$2K support fails, ETH could drop to \$1,540â€”or even \$1,000. Second-largest market capitalization cryptocurrency Ethereum price has dipped below the important \$2,000 handle, touching its November 2023 levels. The steep fall, a 12.4% dip in 24 hours, has left eyebrows raised across the crypto community. But what caused the fall? The latest price action comes on the heels of a fleeting bout of optimism after the previous President Donald Trumpâ€™s proposal of adding Ethereum to a proposed U.S. cryptocurrency reserve. While the news initially triggered a rally, euphoria proved short-lived amid prevalent market worry. Some major reasons are responsible for Ethereumâ€™s recent decline: Macroeconomic uncertainty Offshore markets are in disarray. Geopolitical tensions are increasing and fresh US tariff ideas have unleashed a wave of risk aversion. And, as has been the pattern in previous cycles of the market, crypto tokens, as riskier assets, are the first to absorb the shock. Whale liquidations and exchange supply surges. On-chain data shows that the supply of Ethereum on centralized exchanges recently reached an all-time high of 16.2 million ETH over the last 12 months. Such a spike shows that large holders have been selling their holdings, which totals up to selling pressure. Over \$160 million worth of ETH long positions were realized within a day,

which intensified the price drop. Bearish technical indicators Technical analysis indicates Ethereum price has created a double-top pattern, a bearish indicator that will propel prices even lower if the \$2,000 support is broken. Analysts are speculating about support levels of \$1,540 and even lower to \$1,000, with the more ominous predictions portending a plunge to \$174 levels last seen in 2020. Increased competition and network limitations Ethereum is also under greater threat from more scalable and faster blockchains such as Solana. Layer-2 networks have also redirected traffic away from Ethereum's mainnet, removing direct demand for ETH. Despite Ethereum moving to proof-of-stake, inflationary trends have seeped in with 0.37% supply growth since April 2024. Despite the difficulties of today, the future of Ethereum looks bright with precautions. The exchanges' reserves are once again dropping, which shows the shift toward long-term storage. Future network upgrades such as EIP-7781 are focused on scaling improvements and lowering ETH supply via more aggressive burning of fees. Others opine that if the adoption is accelerated and Ethereum price recovers significant resistance levels like \$2,800, it can bounce back strongly. Bullish estimates see Ethereum breaking to \$7,000 by the fourth quarter of 2025. Although predicated on macroeconomic stability and increasing institutional investment. In total, while Ethereum price has endured a rocky stretch driven by extrinsic market forces, technical letdowns. And increasing selling pressure, it is still well-rooted in the greater blockchain cosmos. Whether it rebounds or heads towards lower support levels is yet to be determined by future economic signals and investor sentiment. Highlighted Crypto News Today Pi Network (PI) Soars 20% as Bullish Indicators Signal Breakout Above \$0.75

Although market experts like CryptoELITES and Javon Marks believe that the Ethereum price and the price of XRP will skyrocket soon, investors are still skeptical. They are rushing to this altcoin in the bonus stage of its presale for guaranteed returns. This is IntelMarkets (INTL), a gem that has already given early investors a 911% return. Another 361% growth is coming soon thanks to a big-time crypto exchange listing it. Since IntelMarkets also has ties to the growing AI market, traders are looking at it as the altcoin with the most upside potential this cycle. Traders Excited for IntelMarkets (INTL) Thanks to Upcoming 361% Surge With the Ethereum price and the price of XRP potentially rising soon, IntelMarkets (INTL) is also making headlines. This presale star has already raised over \$12M and may hit \$15M before this month ends. Also, early buyers of this altcoin are already 911% richer with another 361% growth ahead thanks to a Tier-1 CEX listing. The interest in IntelMarkets was already high as it aims to redefine crypto trading. It will launch the first AI-driven trading platform, setting it apart from its peers like Coinbase. On it, traders will use self-learning trading robots that do not make the same mistake twice. Additionally, their AI models will detect market anomalies before making headlines. These AI features will improve traders' profit potential while lowering their risks. Those who want to get governance voting rights and first dibs on new IntelMarkets features are buying the INTL native token. Demand is high, with over 19M INTL tokens bought in phase ten of its presale alone. This altcoin is now worth just \$0.091, but it will sit at \$0.42 as its listing price. Thanks to this 361% growth, INTL is one of the altcoins to watch for fast returns. CryptoELITES: The Ethereum Price Could Go Up Ethereum (ETH) is one of the top 10 altcoins showing some volatility. CoinMarketCap shows that the Ethereum price fell from around \$2,000 to nearly \$1,500 in the past 30 days. In other words, over a 15% drop in just a few short weeks. Market expert CryptoELITES is still bullish for Ethereum (ETH). His X post boldly claims that this altcoin has hit its bottom. He also said that the Ethereum price will go up soon since all signs point to it. Despite this bullish Ethereum price prediction, some traders are looking at more profitable options. Since it has a high market cap of around \$190B, a lot of new money must come in for the Ethereum price to soar. Meanwhile, altcoins like INTL will not face this issue. Analyst Predicts the Price of XRP May Hit \$16.5 Ripple (XRP) is another altcoin that has been facing some turbulence. On the one-month chart, its value has dropped over 5% per CoinMarketCap. During that time, the price of XRP fell from around \$2.10 to \$2. Nevertheless, some analysts are still confident about the growth of Ripple (XRP). In a recent X post, prominent expert Javon Marks said that history points to the price of XRP potentially soaring to \$16.5. This is a nearly 8x pump, as per his Ripple price prediction. Although this statement has turned some heads, many investors are still skeptical. This is because the price of XRP may have experienced its highest upswings already, as it soared over 220% on the YTD chart. Therefore, traders are focusing on INTL instead. What Gives IntelMarkets (INTL) the Edge Over Ethereum (ETH) and Ripple (XRP)? While the Ethereum price and the price of XRP could see an upward trend soon, all attention is on IntelMarkets (INTL). This project is in the right spot to capitalize on the growth of the AI market, which Grand View Research predicts will be worth \$1.8T by 2030. IntelMarkets could capture just 1% of this market with the trailblazing technology it introduces and make millions. This will give the INTL altcoin more stability in volatile waters and long-term growth potential. Additionally, INTL boasts a smaller market cap than ETH and XRP, which means faster price gains with less new money. As a result, traders are stocking up on this altcoin before its imminent 361% price increase. For more information about IntelMarkets (INTL) visit the links below: - Presale: <https://intelmarkets.io/> - Telegram: <https://t.me/IntelMarketsOfficial> - Twitter: https://x.com/intel_markets Disclaimer: TheNewsCrypto does not endorse any content on this page. - Vitalik Buterin urges users to delegate only to audited contracts to avoid security risks. - EIP-7702 lets EOAs act like smart contracts temporarily, boosting functionality. Ethereum co-founder Vitalik Buterin has responded to growing concerns around EIP-7702, a key part of the upcoming Pectra upgrade. In a Warpcast post, Buterin advised users to delegate only to audited contracts approved by trusted wallet teams. The response came after user critiques surfaced online, highlighting a serious issue. According to an X user, wallets block harmless websites but still allow potentially malicious delegations. This flaw could expose users to phishing attacks and full portfolio loss from just one

signature. To address the risks, Buterin emphasized using a single, secure contract for delegation. He noted that the contract should be thoroughly audited and only execute logic approved by the community. This advice aims to reduce vulnerabilities introduced by the new upgrade. EIP-7702: Power Meets Risk EIP-7702 allows Externally Owned Accounts (EOAs) to act temporarily like smart contracts during a single transaction. This enables advanced functions like batch transactions, gas sponsorships, and custom logic execution. Once the transaction ends, the EOA reverts to its original form. Critics argue that the system's ability to delegate control without strict checks poses a security threat. If users unknowingly grant access to malicious contracts, they could face severe consequences. Buterin's guidance attempts to prevent such outcomes. Originally planned for May 7, the Pectra upgrade will now launch on April 21. Developers moved the date forward after a recent core developers' meeting. The upgrade will integrate EIP-7702 into Ethereum's JSON-RPC interface, allowing delegated state features. Buterin co-authored EIP-7702 with Ansgar Dietrich, Matt Garnett, and Sam Wilson. The proposal aims to improve account abstraction and enhance smart contract functionality. However, the new capability demands extra caution from users. Meanwhile, Buterin also introduced a privacy-focused roadmap for Ethereum. The plan proposes shielded balances, app-specific addresses, and privacy-by-default features. It focuses on enhancing privacy without altering Ethereum's consensus protocol. Highlighted Crypto News Today Binance Confirms Listing of ONDO, BIGTIME and VIRTUAL Following Second Vote to List Round

- Ethereum hovers around \$1.5K after recent losses. - The market has seen over \$89.34 million in ETH liquidations. The crypto market continues to remain under the control of the mighty bears. Major assets had begun to recover but have since lost their recent gains. Following the suit, the largest altcoin, Ethereum (ETH), has posted a notable 4.92% loss. The bearish zone of ETH seems strong enough to resist the emergence of bulls. The asset opened the day trading at around a peak of \$1,624. Later, the bears arrived and pulled the price back toward \$1,474. At the time of writing, Ethereum traded within the \$1,543 range, with the daily trading volume reaching \$20.87 billion. Furthermore, the market has observed a liquidation of \$89.34 million worth of Ethereum as per Coinglass data. Notably, a newly created wallet accumulated 9,610 ETH worth \$14.54 million. Initially, the wallet withdrew a total of 5,000 ETH from Kraken, used it as collateral on Spark to borrow \$7 million in USDS. Later purchased an additional 4,610 ETH at an average price of \$1,518. When Will ETH Bulls Wake Up? Ethereum's active downtrend continues, with the price likely to retrace toward the support range of \$1,493. The reinforced bears could extend the loss, pushing the asset for more downside correction to \$1.3K or even lower. Assuming a wake of bulls that trigger an upside move, the price might climb to \$1,596. Breaking this level could support the bullish wave and send Ethereum to the \$1,642 range. The asset may continue to recover. The asset's Moving Average Convergence Divergence (MACD) line and the signal line are found below the zero line. This bearish crossover hints that Ethereum might decline further to the former lows. Ethereum's current data shows mixed signals. The Chaikin Money Flow (CMF) has inched up to 0.01, hinting at a slight uptick in buying pressure. However, trading activity appears to be cooling off, with daily volume dropping by 40.14%. On the technical side, the Bull Bear Power (BBP) reading stands at 3.79, suggesting some bullish momentum is still in play, helping ETH recover from recent dips. Meanwhile, the Relative Strength Index (RSI) at 46.82, placing Ethereum in a neutral zone without clear overbought or oversold conditions. - Bitcoin dropped 4.1% to \$76,550, while Ethereum slid 8.3%, its lowest since March 2023. - Trump's tariffs intensified trade war fears and global market turmoil. Bitcoin and Ethereum plunged on Wednesday as U.S. President Donald Trump's new tariffs on Chinese goods officially took effect. The sweeping trade measures have sparked a sharp downturn across global markets, triggering \$411 million in crypto liquidations in the past 24 hours. Bitcoin dropped 4.1% to \$76,550, while Ethereum lost 8.3%, marking the steepest fall among the top ten digital assets. Ethereum also hit its lowest level since March 2023. Major altcoins followed suit, adding to the widespread market pain. Traders blamed the plunge on fears that Trump's aggressive tariff policy could deepen the global economic slowdown. "Markets need a circuit breaker on sentiment as much as anything else," said Pav Hundal, lead analyst at Swyftx. He noted that over \$1.2 trillion in crypto value has vanished since February. Global Markets Roiled as Bond Yields Surge According to CoinGlass, liquidations surged as Bitcoin briefly dipped below \$75,000 late Tuesday. This drop occurred less than three hours before the new tariffs kicked in. Since its January high above \$109,000, Bitcoin has fallen nearly 30%. Asian markets also suffered. Japan's Nikkei 225 dropped 2.6% by midday Wednesday. Australia's ASX 200 slid 2%. In the U.S., the S&P 500 fell 1.5% on Tuesday and is now nearing bear market territory with a 20% loss since mid-February. Bond markets reflected the panic. The 10-year Treasury yield spiked between 4.2% and 4.4% Tuesday, posting its fastest intraday rise since World War II. The three-year Treasury auction also flopped, showing weak foreign investor demand. The 30-year yield rose 56 basis points in three trading days. That's the largest such jump since January 1982, according to Bianco Research. "This kind of historic move is caused by a forced liquidation," Jim Bianco posted on X. Rising yields mean falling bond prices and higher government borrowing costs. With U.S. debt already high, this could worsen the federal deficit. At the same time, smaller tokens dropped even further, while traders warned of more downside. Highlighted Crypto News Today Kaspersky Identifies a Crypto-Theft Malware on Microsoft's SourceForge

- WLFI wallet sold 5,471 ETH at \$1,465 just before the project went public. - Technicals show ETH is oversold, with RSI at 35.98 and CMF at -0.21. A wallet allegedly tied to Trump-supported World Liberty Financial (WLFI) sold 5,471 ETH at \$1,465 per coin, according to Lookonchain data sourced from Arkham. The sale, valued at \$8.01 million, occurred just before the news broke, prompting questions about the project's financial position and broader market strategy. WLFI initially spent \$210 million,

acquiring 67,498 ETH at an average of \$3,259 per token. The fire-sale price reflects a steep 55% decline from its entry point, leaving the project nursing an unrealized loss of roughly \$125 million. This decline comes as Ethereum struggles under persistent market pressure, shedding 24% in the past seven days. WLFi's ETH sale aligns with a deeper trend across crypto. Market-wide losses accelerated after Trump's proposed global tariffs rattled investor confidence. Bitcoin has dropped over 20% since February, while altcoins like XRP, Cardano, and Solana plunged up to 50%. Ethereum (ETH) in Today's Market Ethereum currently trades at \$1,480.25, down 5.61% on the day. Its market capitalization stands at \$178.63 billion, with a 24-hour trading volume of \$27.67 billion, down 12.56%. The market cap ratio of 15.59% signals moderate market activity despite the broader sell-off. Technical indicators from TradingView suggest that Ethereum remains under intense bearish pressure. The Relative Strength Index (RSI) is at 35.98, just below its moving average of 30.99, showing weak momentum and signaling that the asset is oversold but not yet poised for a reversal. The Chaikin Money Flow (CMF) stands at -0.21, confirming sustained capital outflows and negative buying pressure. Despite a brief bounce, Ethereum has yet to reclaim key resistance levels. Immediate resistance is observed near \$1,540, while support lies around \$1,420. If the latter breaks, prices could retest the \$1,360 zone. Meanwhile, Lookonchain also tracked two whale transactions unrelated to WLFi. One whale injected 10,000 ETH to prevent liquidation, while another lost 67,570 ETH worth over \$100 million in a failed DeFi position. Highlighted Crypto News Today Is PancakeSwap (CAKE) Gearing Up for a Breakout or Breakdown?

The Ethereum price is currently at a crossroads after falling below \$1,500. Market analysts are waiting to see which direction it could go. Ali Martinez says the Ethereum price could drop to \$1,150 in the next few weeks. Meanwhile, Shiba Inu and an AI coin could rise to new highs in the coming months. SHIB KNIGHT forecasts the Shiba Inu price might pump to \$0.000100. The AI coin called IntelMarkets (INTL) is also expected to rally by 20x this year, making it a top crypto to buy. Ethereum (ETH) Dips Below \$1,500, Ali Says It Could Fall To \$1,150 Following the recent downturn in the market on Monday, the Ethereum price has plummeted to \$1,430. CoinMarketCap info shows the Ethereum price has dropped by 17.0% on the weekly timeframe and 28.7% on the biweekly chart. Meanwhile, bulls have returned to the market. The Ethereum price is starting an uptrend and could reclaim the \$1,500 level in the next few days. However, Hull Moving Average (9) and VWMA (10) indicators are currently in the selling territory, signifying high pressure. Also, Glassnode data shows that whales holding above 10k ETH have dropped by 10% since February. Their numbers have reduced from 999 to 896 due to the ongoing Ethereum price correction. Going forward, Ali Martinez forecasts the Ethereum price might drop to \$1,150. He argued the Ethereum price has broken out of a multi-year triangle pattern and could drop to lower levels. Analyst Forecasts Price Surge for Shiba Inu (SHIB) Amid Decline Over the last week, the Shiba Inu price has been consolidating between \$0.000009 and \$0.000013. Bulls have been attempting to break out from the narrow range but have failed. However, the recent sell-off in the market has caused the Shiba Inu price to decline to \$0.000010. The memecoin is at the risk of adding another zero if the downturn lasts longer. On the positive side, analysts like SHIB KNIGHT are still bullish about the Shiba Inu price trajectory. They believe the correction is a good buying opportunity for investors to stack up more coins. According to SHIB KNIGHT, the one-month Shiba Inu price chart shows a huge accumulation in a falling wedge pattern. The analyst predicted that SHIB could breakout soon. He shared a chart showing that the Shiba Inu price could rally to \$0.000100. The Shiba Inu price has support at the \$0.000008 level if more downward movement occurs. IntelMarkets (INTL): The Smart Money Move Amid ETH's Decline For those who have been observing the Ethereum price downturn, this may be the right time to focus on IntelMarkets's (INTL) 20x potential. The coin is currently trading at \$0.091, an increase of 900% from its initial price. With over \$12.1 million raised from investors, IntelMarkets could become a major rival to the best crypto trading platforms like Bybit. Besides, IntelMarkets is not just a trading platform; it is an AI-driven ecosystem with modern trading tools. The main advantage of IntelMarkets is that it offers real-time processing of data and has Rodeum AI bots that predict market changes. The Rodeum AI bots can comb through thousands of data to get the best trading strategy or profitable opportunities. Also, the bots inform users about whale activities, social media activities, and trends. The most innovative feature is the AI Agent Marketplace. Here, traders can create their own AI models using different inputs or buy ready-made bots from developers who can earn constant revenue on every sale. Is IntelMarkets a Better Crypto To Buy Than Ethereum? The Ethereum price trajectory seems bearish. Meanwhile, IntelMarkets is preparing for a massive rally in the coming months. Its AI utility and growing ecosystem have attracted a lot of interest in its ongoing presale. The adoption and price of IntelMarkets are expected to skyrocket this year, making it one of the best altcoins to watch. For more information about IntelMarkets (INTL) visit the links below: - Presale: <https://intelmarkets.io/> - Telegram: <https://t.me/IntelMarketsOfficial> - Twitter: https://x.com/intel_markets Disclaimer: TheNewsCrypto does not endorse any content on this page. The content depicted in this Press Release does not represent any investment advice. TheNewsCrypto recommends our readers to make decisions based on their own research. TheNewsCrypto is not accountable for any damage or loss related to content, products, or services stated in this Press Release.

- Ethereum is hovering around the \$1.4K level. - Over \$111 million worth of ETH has been liquidated in the market. Bearish signals have kept traders in extreme fear, with the Fear and Greed Index holding at 15. The crypto market cap is on a rollercoaster ride, slipping by over 5.81%, while Ethereum (ETH), the largest altcoin, has registered a steady 9.23% loss. Ethereum has been staying long within the bearish zone. Despite multiple recovery attempts, an upturn seems impossible. In the early hours, ETH traded at a peak of \$1.6K. The encounter with the bears pulled the price down to \$1,386. At this point, Ethereum traded within the \$1,445 range, with the daily trading volume reaching \$25.64 billion. Notably, the market has observed a liquidation of \$111.34 million worth of Ethereum during this interval. Ethereum has witnessed a solid loss of over 22.54% in the last seven days. The asset opened

the week trading at a high of \$1,920. Eventually, the bears took control, and the price reached the current trading level. Can ETH Break Free from the Bearish Grip Anytime Soon? Assuming Ethereum's downtrend continues, the price could likely retrace to the range of \$1,389. An extended loss might trigger the asset to set a stage for more downside correction, leading toward a potent falloff near \$1.2K. While anticipating an upside move, the altcoin might jump to \$1,526. Upon breaking this trading level, the emerged bullish wave could send Ethereum to the \$1.6K range and has the potential to maintain a recovery phase. The Moving Average Convergence Divergence (MACD) line and the signal line of ETH are resting below the zero line. This crossover hints at a sturdy bearish momentum, and the asset might face more losses. Moreover, the Chaikin Money Flow (CMF) indicator at -0.25 infers that capital is flowing out of the asset, exhibiting a bearish signal in the market. Meanwhile, the daily trading volume of Ethereum is down by 39.33%. ETH's daily relative strength index (RSI) at 31.26 indicates that the asset is approaching the oversold territory. Besides, the Bull Bear Power (BBP) reading of -187 suggests that bears are in control of the market.

With Ethereum (ETH) and Avalanche (AVAX) leading the charge, the crypto market is ready for a big explosion in 2025. Macroeconomic issues, institutional adoption, and network advances are lining up to drive these assets into a fresh period of parabolic expansion. Nevertheless, one new altcoin under \$1 is taking the front stage and positioned as the next major participant in the crypto scene. Driven by innovative ideas, Rexas Finance (RXS), a fast-expanding real-world asset (RWA) tokenizing platform, is about to have an explosive climb. Ethereum (ETH): Institutional Adoption and Macroeconomic Tailwinds Although Ethereum is still the foundation of the non-fungible token (NFT) and distributed finance (DeFi) sectors, institutional adoption will be the most effective driver of Ethereum's future growth. The success of spot Ethereum ETFs has opened the floodgates for conventional finance behemoths, increasing capital flows. Once reluctant because of regulatory uncertainties, institutional investors now consider Ethereum a vital player in the digital economy. The macroeconomic situation supports Ethereum's positive view even more. Since the Federal Reserve is predicted to lower interest rates in 2025, investor attitudes will probably change to favor high-growth assets; hence, ETH will benefit the most. Ethereum's market posture as the premier innovative contract platform makes it a top pick for retail and institutional investors as capital searches for exposure to creative digital assets. Avalanche (AVAX): Enterprise and Gaming Adoption Fueling Demand Rising in popularity in business and gaming applications, Avalanche has positioned itself among the most scalable and effective blockchain systems. The growing acceptance of subnets "which let developers and businesses establish customized blockchain networks fit for specific use cases" is a major driver of its expansion. These subnets drive Avalanche's attractiveness among institutional players, helping it become a top blockchain for scalable Web3 apps. Another central element increasing AVAX's possible surge is scarcity. AVAX's built-in burning mechanism constantly lowers the circulating supply, which is limited to 720 million tokens. This deflationary quality and growing acceptance produce a perfect storm for a significant price breakthrough. Avalanche is becoming a top prospect for capital flows as institutional investors investigate other blockchain systems outside Ethereum. Rexas Finance (RXS): The New Altcoin Under \$1 Poised for a Parabolic Surge Although Avalanche and Ethereum are destined for significant rises, Rexas Finance (RXS) is the next altcoin under \$1 that might outperform both. In the crypto realm, the capacity to fractionalize ownership of physical things and trade them on the blockchain opens unprecedented prospects. Rexas Finance (RXS) is becoming rather popular because of its original method of democratizing access to wealth-building assets. Its easy-to-use interface lets institutional and retail investors tokenize actual assets free from long-standing obstacles that dogged asset ownership. This increasing acceptance drives its price velocity, making it a unique competitor for an exponential climb. The project's presale performance has been outstanding. Rexas Finance (RXS) has already generated over \$47.53 million in its presale; the latest stage is priced at \$0.20 and 91.53% complete. Early investors are positioned for significant returns as this is the last presale stage before the token releases at \$0.25. The project has notably turned down venture capital money to ensure the community stays central in its development plan. This choice has increased investor trust since it shows the team's dedication to public involvement in its financial revolution and decentralization. Important accelerators underlying RXS's exploding potential are also security and credibility. One of the most respected blockchain security companies, Certik, has audited the project, strengthening investor confidence. Its presence on CoinMarketCap and CoinGecko has also given great exposure and drawn more traders and investors to the ecosystem. With the launch price set at \$0.25, analysts expect a parabolic spike once it reaches significant exchanges; these essential strengths have driven RXS's presale price by almost 500%. Conclusion Though the catalysts of each asset distinguish Ethereum, Avalanche, and Rexas Finance (RXS) as unique, 2025 marks exponential expansion for all three assets, RXS stands out as the altcoin with the most upside potential because its presale already shows significant momentum and because of its creative approach to real-world asset trading. Early investors could get life-changing profits as its last presale stage closes and its exchange listing becomes ready.
