

transactions, M2 and its affiliated organizations are dedicated to offering and guaranteeing a safe trading experience, maintaining a transparent approach to operations, and preserving the highest levels of regulatory compliance. The largest hashrate marketplace in the world, NiceHash is a platform dedicated to Bitcoin that links miners and buyers. Since 2014, NiceHash, which is headquartered and completely regulated in Switzerland, has led the way in cryptocurrency mining. It should come as no surprise that a large number of institutional miners sell their hashrate on the NiceHash platform, which offers a comprehensive package of software and tools for streamlining large mining operations, including network support, and automated payments.

- CryptoQuant CEO Young Ju, stated that Bitcoin might be showing bearish prices for the next 6-12 months. - Bitcoin's recent trading activity suggests the cryptocurrency entering a consolidation phase. The crypto market has been seemingly entering a consolidation phase over the past few days. The lack of significant action has caused FUD among investors, which has, in turn, initiated a selling spree among short-term traders. Meanwhile, the ETF sector and crypto reserves still show increased activity despite the price slack. Notably, to confirm investors' worst fears, CryptoQuant CEO Ki Young Ju posted a Bitcoin prediction a few hours ago. According to the prediction, Ju states that Bitcoin's bull cycle is officially over. He further noted that for the next 6 to 12 months, we can expect bearish or sideways prices. The community has given much attention to this speculation, discussing it fervently. The CryptoQuant CEO has applied a PCA-risk indicator to on-chain metrics such as MVRV and SOPR. Using this he calculated a 365-day moving average and by identifying inflection points confirmed his analysis. Furthermore, Ki Young Ju also said that with fresh liquidity drying up, new whales are selling their Bitcoin for lower prices. This further acts as a catalyst for bearish trends in the cryptocurrency. BTC is currently trading at the consolidated price of \$83,000. Will Bitcoin's \$80K Consolidation Persist For Longer? Over the past week, Bitcoin has been trading in the \$80K - \$85K range. It has attempted several times to break the \$86,000 resistance but failed to do so. In the last 24 hours, the cryptocurrency has factored in an additional price drop of 0.21%. This caused Bitcoin to trade at the border of \$82K-\$83K levels, after struggling to hold the \$83K support. At the time of writing, BTC was trading at 82,991 as per CMC data. Zooming out, into its weekly chart, the digital asset recorded trading at \$80,354 in the week's beginning. These inferences further confirm the cryptocurrency's consolidation. Combining this with the CryptoQuant CEO's prediction, Bitcoin might face extended periods of trading at this current price range. Meanwhile, other altcoins such as Solana and Cardano have also shown struggles in breaking resistance.

Bitcoin Cash (BCH) made headlines when it reached a record number of transactions, which shows that it works well as a payment option that can grow and perform efficiently. Yet BCH sets a record in transaction numbers while FXGuys draws more investor interest because of strong presale progress. FXGuys now takes over \$4 million at its Stage 3 presale; its \$FXG token sells for \$0.05. Bitcoin Cash builds on fast payment handling, but FXGuys builds a platform for traders that gives clear financial rewards beyond standard payments. As Bitcoin Cash adds more activity to its network, FXGuys marks itself as the next key DeFi choice, attracting traders and investors who want high-yield returns rather than mere blockchain speed. FXGuys Is More Than Just a Token - It's a Trader's Financial Engine Bitcoin Cash's growth is strong, but buyers want more than many transactions. BCH works well for payments, while FXGuys offers a full trading system that pays users for market work. The FXGuys system has a prop trading funding plan that gives traders up to \$500,000 in capital. This element explains why smart prop traders switch from just holding to trading actively with FXGuys. Investors may also stake \$FXG tokens to earn a 20 % profit plus a share of broker trading volume. This staking plan allows investors to gain from ongoing market activity, building a financial setup that provides steady income; Bitcoin Cash does not. FXGuys Offers True Financial Freedom with No KYC and No Fees One of the biggest challenges in cryptocurrencies today is the increasing control of exchanges and regulatory obstacles. While Bitcoin Cash remains an effective payment solution, users must rely on centralized platforms to trade. These platforms require identity verification and impose withdrawal limits. FXGuys removes these obstacles by offering a decentralized trading experience without identity verification. Unlike Bitcoin Cash, which depends on merchant adoption or exchange listings, FXGuys users can trade without any restrictions, ensuring greater access. Additionally, FXGuys does not impose any buy or sell taxes, making it a highly cost-effective trading platform. Traders and investors can withdraw fiat and cryptocurrencies instantly in over 100 local currencies, giving FXGuys an edge over services that delay withdrawals or impose unnecessary fees. The FXGuys ecosystem supports various trading platforms, including MT5, Match-Trader, cTrader, and DXtrade, ensuring that users have the necessary tools for success. Trade2Earn Model Creates a Self-Sustaining Demand for FXGuys One of FXGuys's biggest assets compared to Bitcoin Cash is its Trade2Earn model, which compensates users for each trade. For every trade made on FXGuys, users get extra \$FXG tokens, which builds token demand while paying active traders. Bitcoin Cash may handle transactions well but does not give clear financial rewards to holders or traders. FXGuys, however, builds a lasting financial system that helps its users beyond basic payments. FXGuys's \$4M Presale Shows Where the Market Is Headed With over \$4 million raised plus a presale cost set at \$0.05, FXGuys shows investors leave behind traditional blockchain assets like Bitcoin Cash for projects that let them earn money directly. Bitcoin Cash works well as a system for transactions; FXGuys offers a setup where traders add to their wealth through staking, prop trading, Trade2Earn rewards. More investors switch to options that give clear money benefits; FXGuys is the top option for traders or investors. The only question remains: Do you choose fast transactions or try a setup that helps you build wealth? FXGuys prepares for a wide uptake; investors clearly choose money growth over blockchain excitement. To find out more about FXGuys follow the links below: [Presale](#) | [Website](#) | [Whitepaper](#) | [Socials](#) | [Audit Disclaimer](#): TheNewsCrypto does not endorse any content on this page. stated in this Press Release.

- A dormant whale booked an \$85M profit, and miners cashed out \$27M, increasing selling pressure on Bitcoin. - U.S. spot Bitcoin ETFs have recorded five consecutive weeks of outflows, raising concerns over institutional support. - While BTC shows signs of recovery, a post-retest reversal could push the price down to the \$75,533 Fibonacci level. Fluctuating near \$83,000, Bitcoin is at a decisive moment. Following a 2.12% pullback on Sunday, BTC posted a minor 0.83% gain to start the week. However, this recovery could be a retest of a broken trendline, which may lead to a potential price reversal toward \$75,000. Dormant Whale Cashes Out \$85M in Bitcoin As Bitcoin hangs in uncertainty, a long-dormant whale has moved to book massive profits. According to SpotOnChain, the entity deposited 300 BTC worth \$25.1 million on FalconX after holding the asset for nearly 1.5 years. The whale had originally purchased 1,500 BTC from Cumberland on August 18, 2023, at an average cost of \$26,353, totaling \$39.5 million. Now, with BTC near \$83K, the whale has strategically shifted holdings, transferring 1,050 BTC worth \$87.2 million to two new wallets while leaving 150 BTC worth \$12.5 million in the original address. In addition to the whale's profit-taking, Bitcoin miners have also ramped up their selling activity. Crypto analyst Ali Martinez highlighted that BTC miners have collectively cashed out over \$27 million this month, as shown by CryptoQuant data. The surge in miner profit realization indicates increased selling pressure, which could contribute to a potential BTC price downturn. Adding to Bitcoin's challenges, U.S. spot Bitcoin ETFs have recorded five consecutive weeks of outflows. In February alone, these funds saw a \$3.56 billion outflow, and March has already witnessed an additional \$1.67 billion in withdrawals. Since February 6, only four days have recorded inflows, raising concerns about declining institutional interest. With ETF outflows rising, the risk of another negative weekly performance increases. This trend could further weigh on Bitcoin's price, reinforcing the bearish outlook. On the daily chart, BTC has shown a lower price rejection, sustaining its recovery above the 61.80% Fibonacci level at \$81,855. The Bollinger Bands indicate a rebound from the lower band to the 20-day SMA, suggesting a potential bullish move. Meanwhile, the MACD's positive crossover signals possible upward momentum. However, the recovery may be short-lived. Analysts warn that the current uptrend could be a post-retest reversal, meaning BTC could drop toward the 50% Fibonacci level at \$75,533 if sellers gain control. On the bullish front, Ali Martinez suggests that BTC is forming an ascending triangle pattern, which could drive an 8% price surge. If this pattern plays out, BTC could climb to the 78.60% Fibonacci level near \$91,780.

- A Bitcoin whale opened a \$450M short position on Hyperliquid with 40x leverage. - The whale deposited \$5M in USDC to strengthen its position and avoid liquidation. A Bitcoin whale on Hyperliquid is facing a coordinated effort to force liquidation after opening a \$450 million short position with 40x leverage. The trader's aggressive move has drawn widespread attention from the crypto community, triggering a "manhunt" led by traders aiming to counteract the position. The trader first opened the massive short position on March 16, initially valued at over \$300 million. By March 17, the position had grown to 5,167 BTC, worth around \$429 million. The whale closed two positions through Time-Weighted Average Price (TWAP) for a total of 208 BTC, valued at over \$18 million. At 4:30 AM UTC, the whale deposited \$7.5 million in collateral to avoid liquidation. On-chain data shows an unrealized loss of \$1.1 million in profit and loss (PNL). However, the trader's short position remains active, with an unrealized profit of \$4 million. Coordinated Efforts to Liquidate the Whale Crypto trader @Cbb0fe, also known as CBB, identified the whale's short position and called for a coordinated effort to liquidate it. CBB urged traders to message them if they were willing to participate, requiring a minimum 7-figure commitment. As a result, the whale was forced to deposit \$5 million in USDC to maintain margin requirements. However, the effort failed as the whale reinforced its position by continuing to short BTC through TWAP orders. Hyperliquid acknowledged the viral short trade, highlighting its platform's role in hosting high-stakes market activity. "When a whale shorts \$450M+ BTC and wants a public audience, it's only possible on Hyperliquid," the platform stated. The incident is not the trader's first controversial move. Earlier this month, they opened a 50x leveraged Ethereum position worth \$340 million, leading to a \$4 million loss for Hyperliquid. The platform later adjusted its risk management strategies to mitigate future risks. Highlighted Crypto News Today BSC Surpasses Solana DEX Volume as CZ Buys MUBARAK Memecoin

- North Korean Lazarus group holds more Bitcoins than El Salvador and Bhutan. - Lazarus group converted all the stolen Ethereum in Bybit hack into Bitcoins. The Democratic People's Republic of Korea (DPRK) has become popular for crypto hacks. Chainalysis report also highlighted that most of the hacks have DPRK behind them. The recent Bybit hack is also linked to DPRK's Lazarus group. It is now making headlines, holding more Bitcoins than El Salvador and Bhutan. As per the Arkham Intelligence platform, Lazarus Group's portfolio is worth \$1,159,960,333.48 at present. It holds 13,518 Bitcoins, 13,702 Ether, 5,022 BNB tokens, and other stablecoins. Bitcoins amount to a major share of its portfolio, being worth \$1.13 billion. Lazarus Group surpassed El Salvador and Bhutan in terms of BTC holdings. While El Salvador holds 6,118 BTC, Bhutan holds 10,635 Bitcoins. El Salvador continued to buy Bitcoins ever since it announced Bitcoin as a legal tender in the country. On the other hand, Bhutan accumulated most of its holdings through domestic Bitcoin mining over the past few years. Lazarus Group of North Korea Converted Ethereum from Bybit Hack to Bitcoin Lazarus group stole around \$1.4 billion worth of Ethereum from the Bybit hack and sent shockwaves through the industry. It steadily laundered funds through multiple wallet addresses. The hacker group converted a major portion of the stolen Ethereum to Bitcoin using THORChain. Even though Bybit CEO Ben Zhou has been making efforts to trace the stolen funds, they didn't seem to have any effect. He created the Lazarusbounty.com website which shares updates regarding the stolen funds. In one of his X posts, Ben Zhou shared that 77% of the stolen funds are still traceable. On the other hand, the hacker group in North Korea laundered total funds and even converted them into Bitcoins. Meanwhile, the OKX crypto exchange suspended its DEX services temporarily to improve security because the hacker group used its

Originally published in 2014 and under \$21 until 2017, Ethereum trades at \$2,400 and has an all-time high of \$4,891. Likewise, Bitcoin appreciated from just pennies to its current all-time high of \$109,114, which was useless at its original mining in 2009. These amazing increases made early adopters millionaires, confirming that cryptocurrencies are unusual but transforming investment opportunities. Rexas Finance (RXS), a self-made crypto millionaire, has found another altcoin ready to emulate ETH and BTC. With its creative approach to real-world asset (RWA) tokenization destined to alter the financial scene, this new Bitcoin is being praised as a once-in-a-lifetime opportunity. Rexas Finance (RXS): The New Once-In-A-Lifetime Altcoin in the Crypto Market Blockchain technology marks a new age, represented by Rexas Finance (RXS). Designed to democratize and simplify access to tokenized real-world assets, Rexas Finance enables people and organizations to easily produce, exchange, and oversee digital versions of tangible objects. These include real estate, art, intellectual property, and commodities, all of which RXS easily and transparently facilitates worldwide tokenization. Rexas Finance is a special investment because of its accessibility and creativity. Unlike most conventional cryptocurrencies, which only consider digital value exchange, RXS closes the gap between physical and digital assets, generating almost endless possibilities for investors. Its solid foundations and fast-expanding community help define it as the next major cryptocurrency breakthrough. Rexas Finance (RXS) Presale: A Record-Breaking Performance Rexas Finance's (RXS) presale performance shows its strength since it surpasses market expectations. Pricing at \$0.20, RXS is in its 12th and last presale round after having raised over \$46.76 million thus far. The tremendous investor demand indicates a strong conviction in its long-term potential even if 90.76% of its \$56 million presale target is already filled. The Rexas Finance team has chosen a public presale instead of many initiatives seeking venture capital money so that regular investors may join this innovative movement. Officially set at \$0.25, the token should be shown on June 19, 2025. Given that RXS is already slated to be listed on three top ten tier-1 exchanges, this listing will be noteworthy. Due to community support and significant exchange backing, RXS is expected to soar after its official launch. The Certik audit of Rexas Finance is among the most important elements influencing confidence. Since security is a major issue in the crypto market, a Certik-certified audit gives investors trust and guarantees project validity. Following its listings on CoinMarketCap and CoinGecko, RXS has also become popular, increasing investor confidence and supporting the fast presale expansion. Can Rexas Finance (RXS) Replicate the Success of Bitcoin and Ethereum? Bitcoin and Ethereum are legendary because they offer huge rewards over time. Bitcoin climbed from fractions of a cent to over \$109,000, and Ethereum jumped from under a dollar to almost \$5,000. With a faster development path, crypto analysts and self-made millionaires are now recognizing similar promises in Rexas Finance (RXS). RXS is positioned to explode greatly, given the rising acceptance of RWA tokenization and the great market demand for creative blockchain solutions. Reflecting the explosive rise of ETH and BTC but in a shorter period, some analysts estimate its price could soar by over 700,000% in the next years. The growing interest in real-world asset tokenization, a market expected to reach trillions of dollars in value, explains this expected exponential rise. The Best Time to Get Involved in Rexas Finance (RXS) According to history, early identification of highly promising ideas yields the largest increases in cryptocurrency. Those who bought Bitcoin or Ethereum early on had transforming returns. Now Rexas Finance (RXS) offers a similar prospect; with its presale almost finished, this could be the last chance to get in before a significant price increase. With a launch date of June 19, 2025, and verified listings on elite exchanges, RXS is primed for explosive expansion. As the project gathers momentum, its value surpassing expectations via popular adoption could be one of the most fulfilling investments of this decade. Many times, crypto billionaires are people who see and seize possibilities before the general public. One such unusual investment that promises unmatched development in the changing digital economy is Rexas Finance (RXS). For more information about Rexas Finance (RXS) visit the links below: - Website: <https://rexas.com> - Win \$1 Million Giveaway: <https://bit.ly/Rexas1M> - Whitepaper: <https://rexas.com/rexas-whitepaper.pdf> - Twitter/X: <https://x.com/rexasfinance> - Telegram: <https://t.me/rexasfinance> Disclaimer: TheNewsCrypto does not endorse any content on this page. - The Bank of Korea now officially dismissed Bitcoin as a foreign exchange reserve due to inherent risk and volatile nature. - The decision was made amid growing global interest in national Bitcoin reserves, led by the U.S. and other countries. The Bank of Korea (BOK) has officially rejected the idea of considering Bitcoin (BTC) in its foreign exchange reserves, mainly because of its volatile nature and liquidity concerns. In a response to an inquiry from lawmaker Cha Gyu-geum, the central bank stated, the central bank has confirmed that it had neither reviewed nor considered Bitcoin for reserves. This was revealed by a KoreanHerald, a reputable Korean media company. "Bitcoin's price volatility is very high," the BOK emphasized, and also believe transaction cost will rise during market downturn. The central bank also made references to International Monetary Fund (IMF) guidelines, which requires any reserve asset to possess massive liquidity, stability and credit ratings, which Bitcoin currency lacks. Despite increasing global discussions on digital assets in national reserves, South Korea remains cautious. The stance contrasts with the United States, where President Donald Trump recently announced a strategic Bitcoin stockpile, fueling debates on its role in global finance. Political Pressure Grows, But Central Bank Stays Resistant The rejection comes amid rising political interest in crypto integration. Some lawmakers, especially from South Korea's Democratic Party, have pushed for a national Bitcoin reserve. Crypto lobbyists have also urged the country to explore stablecoin-backed reserves to modernize its financial strategy. However, the BOK has remained firm, stressing that foreign exchange reserves must be immediately usable. "Reserves should be available for immediate use whenever needed," the bank stated, dismissing Bitcoin's role

as a reliable asset. Prof. Yang Jun-seok of Catholic University of Korea echoed this sentiment, arguing that reserves should be proportional to trade currencies. “Unless major economies issue bonds in Bitcoin, its advantage as a reserve asset is limited,” he explained. While political momentum builds, the BOK is unlikely to shift its stance unless global financial institutions, like the IMF, formally recognize crypto assets as viable reserves. Global Trends: The Divide on Bitcoin as a Reserve Asset South Korea’s caution aligns with the views of other major economies. The European Central Bank, the Swiss National Bank, and the Japanese government have all voiced skepticism about adding Bitcoin to reserves. Meanwhile, the U.S. has taken a different approach. Trump’s executive order to stockpile Bitcoin has fueled speculation that more nations may follow. Brazil and the Czech Republic have also expressed interest in Bitcoin reserves, highlighting the growing divide in global financial policy. Prof. Kang Tae-soo of KAIST Graduate School of Finance believes stablecoins may be a more viable option. “The U.S. is likely to leverage stablecoins rather than Bitcoin to maintain dollar hegemony. Whether the IMF will recognize stablecoins as reserves in the future is important,” he stated. However, South Korea is taking a wait-and-see approach. With Bitcoin’s price currently fluctuating from \$80,000 to \$76,000 in just 30 days—the central bank remains unconvinced of its stability. Highlighted Crypto News for Today

- Bitcoin (BTC) is holding above \$82K but faces resistance near \$85K. - The market cap stands at \$1.63T, with trading volume down 48.64%. Bitcoin (BTC) is trading at \$82,667, down 2.11% in the past 24 hours. The market cap has slipped to \$1.63 trillion, reflecting a 2.06% decline. Trading volume has dropped 48.64% to \$13.6 billion, bringing the market cap ratio to 0.8292%. Brazil is making strides in digital finance with a proposal to allow employees to receive salaries in Bitcoin. Meanwhile, Goldman Sachs and BlackRock have ramped up their BTC exposure. These investments highlight Bitcoin’s growing presence in traditional finance, encouraging institutional investors to reconsider crypto allocations despite macroeconomic uncertainties. Will BTC Regain Its Momentum? Bitcoin faces immediate resistance at \$83,151. If bulls push past this level, BTC could rally toward \$85,000, with a potential test of \$86,500 if momentum strengthens. On the downside, the nearest support is \$82,400. A break below this level could send Bitcoin toward \$80,000, with a deeper correction possible near \$78,500. The 14-day RSI stands at 53.90, indicating neutral momentum. The RSI moving average is 45.34, which is slightly below the current RSI, suggesting a mild upward trend. If the RSI crosses above 60, bullish momentum could strengthen, pushing BTC toward higher resistance levels. However, if it drops below 45, selling pressure may increase. The Chaikin Money Flow (CMF) is at 0.01, signaling weak capital inflows. If CMF rises above 0.05, it would confirm stronger demand from investors. A dip below -0.05 could indicate growing outflows, increasing bearish pressure. The 50-day moving average (MA) remains below the 200-day MA, forming a bearish crossover. This suggests Bitcoin could struggle to maintain upward momentum unless it breaks key resistance levels. If Bitcoin holds above \$82,400, it may attempt a breakout toward \$85K–\$90K in the coming weeks. Highlighted Crypto News Today Hayden Davis Launches \$WOLF Token Amid Interpol Red Notice

What if it were possible to go back in time and buy Bitcoin at its ICO price? That opportunity is long gone, but history often repeats itself in new ways. In 2009, Bitcoin quietly emerged as a decentralized alternative to traditional finance, offering early participants a rare chance to enter at a fraction of a cent. Those who recognized its potential saw returns beyond imagination. However, Bitcoin’s early window is closed, and today’s entry points are significantly higher. That doesn’t mean the chance for substantial growth in blockchain investments is over. Qubetics is shaping up to be the next major contender, offering something that early blockchain projects couldn’t—enhanced security, and real-world usability. Unlike Bitcoin, which functions primarily as a store of value, Qubetics introduces a Non-Custodial Multi-Chain Wallet bringing practical applications to businesses and individuals alike. For those who missed Bitcoin’s early days, Qubetics presents a new avenue to engage with blockchain innovation at an early stage. Qubetics: Your Chance at Redemption Qubetics is redefining digital asset management with its Non-Custodial Multi-Chain Wallet, a feature designed to solve one of crypto’s biggest challenges—seamless interaction between multiple blockchains. Many users struggle with juggling different wallets for Bitcoin, Ethereum, Solana, and Binance Smart Chain, leading to inefficiencies, security risks, and lost assets. Qubetics simplifies this by allowing users to store, manage, and transact digital assets across multiple networks in a single, user-friendly interface. Security remains a top priority. Unlike centralized wallets that hold users’ private keys, Qubetics’ Non-Custodial Multi-Chain Wallet ensures that individuals maintain full control over their funds, eliminating third-party vulnerabilities. This technology is particularly beneficial for businesses and professionals managing cross-chain transactions. This level of innovation positions Qubetics as one of the best cryptos to buy this month with real-world applications and strong technological foundations. Qubetics is in its 25th crypto presale stage, with \$TICS tokens priced at \$0.1074. The presale has gained immense traction, raising over \$15 million, attracting more than 23,000 token holders, with over 499 million \$TICS tokens sold. For those looking at potential returns, analysts predict \$TICS could reach \$0.25 post-presale (133% ROI). Projections suggest further growth to \$1, \$5, or even \$10 after the mainnet launch, with potential ROIs of 831%, 4,553%, and 9,207%, respectively. Bitcoin: The Pioneer of Cryptocurrency Bitcoin’s 2009 ICO was unlike anything the financial world had seen. Initially distributed through mining, Bitcoin offered a new financial paradigm—one that removed intermediaries and gave individuals control over their money. Its early adopters, who mined or purchased BTC at fractions of a cent, saw exponential gains as Bitcoin surged to all-time highs. Despite its historical significance, Bitcoin operates primarily as a store of value rather than an ecosystem for real-world applications. The blockchain, though secure, lacks the flexibility needed for multi-chain interactions and real-world asset integration. While Bitcoin remains the most widely recognized digital asset, newer projects like Qubetics aim to expand blockchain’s capabilities beyond a financial asset and into a functional, scalable ecosystem. This is why those seeking the best cryptos to buy this month

should look beyond just Bitcoin. Conclusion Bitcoin's early investors saw massive returns, but for those who missed out, there is still an opportunity to engage in the next wave of blockchain innovation. Qubetics presents a second chance to get in early on a project with real-world applications, interoperability, and strong growth potential. Its Non-Custodial Multi-Chain Wallet solves one of the most pressing challenges in crypto today, offering a secure, seamless, and user-friendly solution for cross-chain transactions. While Bitcoin has established itself as the foundation of cryptocurrency, Qubetics represents the next evolution—a blockchain project that integrates usability, security, and scalability. As one of the best cryptos to buy this month, it provides a rare opportunity to participate in an early-stage project with strong fundamentals. For More Information: - Qubetics: <https://qubetics.com> - Presale: <https://buy.qubetics.com/> - Telegram: <https://t.me/qubetics> - Twitter: <https://x.com/qubetics> Disclaimer: TheNewsCrypto does not endorse any content on this page. Bitcoin's path to \$150K; How Lightchain AI and Solana are shaping the future of blockchain. As Bitcoin climbs higher, Lightchain AI and Solana are emerging as game-changers in the crypto space. Lightchain AI, which raised \$17.7 million at a presale price of \$0.00712, combines AI and blockchain to power scalable, efficient decentralized applications. Meanwhile, Solana's high-speed transaction capabilities continue to attract attention. Together, these platforms are redefining possibilities in the crypto world and paving the way for significant growth in 2025 and beyond. Bitcoin's Path to \$150K- What's Fueling Surge? Bitcoin's path toward the \$150,000 mark is being driven by several key factors. First, government initiatives have played a significant role. President Donald Trump's executive order to establish a government Bitcoin reserve has boosted confidence in the cryptocurrency's future, signaling strong institutional support. Regulatory developments are another critical factor. The U.S. Securities and Exchange Commission (SEC) has approved spot Bitcoin ETFs, allowing for greater institutional investment. This approval has enhanced Bitcoin's credibility and made it more accessible to a wider range of investors. Market cycles also contribute to Bitcoin's price movements. Historically, Bitcoin's price surges have coincided with its halving events, which reduce the rate of new Bitcoin creation. These supply constraints often lead to increased demand and higher prices. Lastly, macroeconomic factors play a role. The Federal Reserve's anticipated interest rate cuts may increase liquidity in financial markets, encouraging more investment in Bitcoin as investors seek higher returns. Together, these factors create a supportive environment for Bitcoin, strengthening projections that it could reach or even surpass \$150,000 in the near future. How Lightchain AI and Solana Are Shaping Future of Crypto Lightchain AI and Solana are pioneering advancements in the cryptocurrency landscape, each contributing uniquely to its evolution. Lightchain AI seamlessly integrates artificial intelligence with blockchain technology, offering scalable and efficient solutions for decentralized applications. Its innovative approach has attracted significant investor interest, raising over \$17.7 million at a presale price of \$0.00712 per token. This substantial funding underscores the market's confidence in Lightchain AI's potential to deliver real-world applications beyond speculative trading. Solana, on the other hand, has emerged as a formidable competitor to established blockchains like Ethereum. Renowned for its high transaction throughput and low fees, Solana is now generating more fees than Ethereum, offering users a faster and more cost-effective service. This efficiency has positioned Solana as a preferred platform for decentralized finance (DeFi) projects and non-fungible token (NFT) marketplaces, thereby expanding the crypto ecosystem's accessibility and functionality. Collectively, Lightchain AI and Solana are shaping the future of crypto by addressing scalability, efficiency, and practical application challenges, paving the way for broader adoption and integration of blockchain technologies. Lightchain AI- Set to Lead Next Crypto Boom! Lightchain AI is gaining momentum as a leading altcoin in the 2025 crypto market. Unlike speculative tokens, it integrates AI with blockchain to drive real-world applications, offering a strong use case beyond trading. With a focus on scalability and decentralized AI solutions, Lightchain AI is positioned to capitalize on the growing demand for AI-driven blockchain utilities. As investor confidence surges, its upcoming mainnet launch could further solidify its role as a key player in the next crypto boom. Do not miss out on the opportunity to be part of Lightchain AI's groundbreaking journey and its potential to shape the future of crypto. - <https://lightchain.ai> - <https://lightchain.ai/lightchain-whitepaper.pdf> - <https://x.com/LightchainAI> - <https://t.me/LightchainProtocol> Disclaimer: TheNewsCrypto does not endorse any content on this page. - Bitcoin (BTC's) apparent demand fell to -142 on March 13, the lowest in 2025. - Analysts suggest that BTC must close above \$89,000 to avoid a deeper correction. Bitcoin demand has dropped to its lowest level this year, according to CryptoQuant. The apparent demand metric fell to negative 142 on March 13, marking a sharp decline since its peak in December 2024. Investors are shifting away from risk assets due to macroeconomic uncertainty, geopolitical tensions, and stubborn inflation. The weakest Bitcoin demand of the year — CryptoQuant.com (@cryptoquant_com) March 14, 2025 — Demand has been weakening since December and continues to decline over time. This suggests that investors are becoming more cautious and may be shifting toward less risky assets. — By @Darkfost_Coc Read more — <https://t.co/0aw9CEFHpe> [pic.twitter.com/NRqS1k6t3g](https://t.co/0aw9CEFHpe) Bitcoin has struggled to reclaim the \$100,000 level. Since January, its price has fallen over 22% from a high of \$109,000. It now trades below its 200-day exponential moving average (EMA), a key technical indicator. Crypto analyst Matthew Hyland warns that Bitcoin must close above \$89,000 on the weekly chart to avoid further declines to \$69,000. The post-election hype faded after the White House Crypto Summit on March 7. Despite lower than expected CPI inflation on March 12, Bitcoin's price dropped after the report. Crypto ETFs have also

suffered. Since February, they have seen four consecutive weeks of outflows, totaling \$4.75 billion. Market Signals No Prolonged Bear Trend Bitcoin investment vehicles alone recorded \$756 million in outflows this month. Poor sentiment and recession fears have fueled panic selling. The Total3 Market Cap, which excludes Bitcoin and Ethereum, has plunged 27% since Trump's inauguration, falling from \$1.1 trillion to \$795 billion. Despite the decline in demand, CryptoQuant CEO Ki Young Ju does not see this as a sign of a prolonged bear market. He argues that demand slowdowns are common in volatile markets. Several on-chain metrics suggest the broader market is not in panic mode. Long-term investors continue to hold, and institutional interest remains steady. Exchange inflows are low, suggesting reduced selling pressure. Accumulation addresses are slowing but remain active. Bitcoin's Average True Range (ATR), which measures volatility, is at 5,035, indicating strong price swings. Highlighted Crypto News Today SUI Price Rebounds Over 11% as Crypto Market Sees Modest Recovery

- Bitcoin has factored in a modest price increase of 2.98% in the last 24 hours. - The cryptocurrency's daily trading volume has dropped by 4.93% as per CMC data. The cryptocurrency market has staggered into the recovery lane yet again in the last 24 hours. With leading cryptocurrencies attempting to break previous resistance levels, the community is quite hopeful. Meanwhile, Brazil announced plans to pitch crypto adoption to the members of the BRICS in the past day as a testimony to growing global crypto adoption. Notably, the largest cryptocurrency, Bitcoin has factored in a modest price increase of 2.98% in the last 24 hours. This increase helped the token progress to the \$84,000 range after several days. In the morning hours of March 14, the altcoin was trading at a low of \$81,771. However, as bullish candles sparked, the cryptocurrency even tested an intra-day high of \$85,263. Afterward, due to slight corrections, it fell into the aforementioned range. At the time of writing, BTC was trading at \$84,287 as per CMC data. Zooming out, into its weekly chart, owing to recent surges, Bitcoin depicts its price drop to a modest 1.81%. At the week's beginning, BTC was trading at the \$86K level, before the significant market crashes occurred. Leading analysts had predicted a support level of \$69,000 and whether it will materialize in the coming days is a looming question. Will Bitcoin Hit \$90K Soon? On analyzing its technical indicators BTC shows mixed signals. Its short-term bull power indicator stands at 1.80 and the short-term bear power indicator stands at -0.22. This suggests that Bitcoin could pull effectively out of the bearish hold. However, its long-term bear power indicator value is -5.22. This reading highlights existing overpowering bears in the market. Moreover, its RSI value stands at 44.11 as per TradingView data. Investors seem to hold a negative sentiment as the token lies in the oversold zone. If Bitcoin manages to sustain its current positive momentum, it might hit \$90,000 in the coming days. Meanwhile, other altcoins such as SEI and Avalanche showed upward movements in the past few days.

A few altcoins are ready to fade as Bitcoin doubles in value this year. Three altcoins that have the potential to create enormous returns are Rexas Finance (RXS), The Graph (GRT), and Sei (SEI), which would turn a meager \$1,000 investment into a startling \$40,000. Rexas Finance (RXS): The Leader in Real Estate Tokenization The Rexas Finance (RXS) token, which enables quick and cheap transactions throughout the network, is fundamental to the ecosystem. Beyond real estate, Rexas Finance (RXS) is vital in the broader DeFi industry, supporting staking, lending, and borrowing services. This adaptability guarantees constant demand for the coin, confirming its long-term expansion possibilities. Right now, in stage 12 its last presale stage Rexas Finance (RXS) is offering tokens for \$0.20. The presale has been an absolute success, raising over \$46.6 million and selling more than 453.1 million tokens. With 90.64% of the stage occupied, demand for Rexas Finance (RXS) stays strong. One of Rexas Finance's (RXS) best features is the QuickMint Bot, which streamlines token production for non-technical users. Access to the tokenization market is simple on sites like Telegram and Discord. Moreover, Rexas's AI Computer Generating Graphics NFT function transforms digital art by allowing flawless NFT generation, which appeals to content creators and artists. Investors can visit the official Rexas Finance (RXS) website to participate in the presale, link their wallets, and purchase Rexas Finance (RXS) tokens using Ethereum or USDT. Rexas Finance (RXS) is profitable since early adopters can lock in tokens before the price surges upon listing. The Graph (GRT): The Backbone of Web3 Data Infrastructure The Graph acts as an indexing system for searching data from distributed systems like Ethereum and IPFS. It is essential in DeFi and Web3 since it lets creators of open APIs (subgraphs) efficiently query apps using GraphQL. Resources are distributed using GRT, the network's ERC-20 currency. This currency also rewards indexers and motivates delegates and Curators. Since the ecosystem depends on its capacity to streamline blockchain data access, Web 3 developers find it essential. Currently valued at \$0.14 as of writing, The Graph promises a high-growth prospect. As blockchain acceptance rises, demand for smooth data indexing solutions will increase, driving GRT's price upward. GRT is among the most important infrastructure tokens available since it can close the distance between distributed apps (dApps) and blockchain data. The Graph's long-term potential lies in its ability to propel blockchain development forward. Given the rapid expansion of the Web3 ecosystem, GRT's function as a basic data source makes investing in it interesting. Sei (SEI): The Fastest Blockchain for Decentralized Trading Sei Network is the first Layer-1 blockchain, specially made for distributed exchanges (DEXs). Sei gives consumers engaged in DeFi, gaming, and NFTs a flawless trading experience with lightning-fast transaction rates and outstanding throughput. Since Sei's parallelized transaction execution raises scalability and efficiency, it is among its best features. Sei's design offers minimal latency and near-instant finality, unlike blockchains suffering from congestion, which appeals to traders and developers. Furthermore, Sei's environmentally friendly approach fits the rising need for sustainable blockchain solutions. The network's energy-efficient consensus method guarantees less influence on the environment while preserving excellent performance. At \$0.28 as of this writing, Sei presents a reasonably priced starting point with much upward potential. Sei's better technology positions it as a major participant in the blockchain scene as the demand for distributed finance and on-chain trading keeps exploding. Conclusion Although the possible price explosion of Bitcoin will surely draw public

attention, the actual gains are found in highly prospective cryptocurrencies such as Rexas Finance (RXS), The Graph (GRT), and Sei (SEI). These tokens offer special value propositions targeted at important areas of blockchain innovation, such as real estate tokenization, Web3 infrastructure, and distributed trading. These three cryptocurrencies give investors the best opportunity to multiply their money given Rexas Finance's real estate disturbance, The Graph's Web3 indexing supremacy, and Sei's DEX-oriented speed and efficiency. An investment of \$1,000 in these cryptocurrencies may soar to \$40,000 by the time Bitcoin halves, presenting some of the most profitable prospects on the market now. For more information about Rexas Finance (RXS) visit the links below: - Website: <https://rexas.com> - Win \$1 Million Giveaway: <https://bit.ly/Rexas1M> - Whitepaper: <https://rexas.com/rexas-whitepaper.pdf> - Twitter/X: <https://x.com/rexasfinance> - Telegram: <https://t.me/rexasfinance> Disclaimer: TheNewsCrypto does not endorse any content on this page. The crypto world is buzzing with excitement as Top Meme Coins to Join Now continue to shake up the market, turning internet humor into serious investment opportunities. What once started as internet jokes has now turned into serious investment opportunities, with meme coins proving they're more than just a passing trend. Among the latest breakout stars are Arctic Pablo Coin, Dog (Bitcoin), and TURBO—each bringing its own unique appeal, community-driven momentum, and potential for massive returns. Whether it's the thrilling adventure narrative of Arctic Pablo Coin, the rising bullish sentiment around Dog (Bitcoin), or TURBO's innovative AI-driven approach, these coins are making waves in the market.

Arctic Pablo Coin: The Most Thrilling Pick Among Top New Meme Coins to Join Now

In the frosty realms of the crypto world, Arctic Pablo Coin (\$APC) stands out as one of the Top New Meme Coins to Join Now, capturing the imagination of adventurers and investors alike. This meme coin presale isn't just about hype—it weaves an enthralling narrative, inviting participants to join Arctic Pablo on his legendary quest through enchanted terrains, uncovering ancient mysteries and hidden treasures. But beyond its captivating storyline, what makes Arctic Pablo Coin a compelling investment? Currently, Arctic Pablo Coin is in its 14th presale location, "Frosty Falls," with tokens priced at a mere \$0.000074. As one of the Top New Meme Coins to Join Now, this phase has already attracted over \$1.87 million, reflecting strong community backing. Investors who seize this opportunity now could see a massive 10,694.59% ROI when the token lists at \$0.008. But here's the catch—this entry point won't last forever. The presale follows Arctic Pablo's journey, with each new location triggering a price increase. Unsold tokens are burned weekly, creating a deflationary effect that enhances scarcity and future value. This means that once this phase ends, the opportunity to invest at this rock-bottom price will be gone. Acting now is the smart move if you're looking for serious returns. Beyond the presale excitement, Arctic Pablo Coin offers an enticing 66% APY staking program, making it one of the Top New Meme Coins to Join Now with built-in earning potential. Investors can stake their \$APC tokens and watch their holdings multiply, with all staked tokens vested for two months post-launch. This initiative strengthens the ecosystem while rewarding long-term holders with generous passive income. One of the most defining features of Arctic Pablo Coin is its deflationary tokenomics. Unsold tokens from each presale location are permanently burned, reducing supply and driving up scarcity. This strategy ensures long-term value growth, reinforcing Arctic Pablo Coin's status as one of the Top New Meme Coins to Join Now.

Dog (Bitcoin): The Canine-Inspired Crypto with Renewed Momentum

Dog (Bitcoin) (\$DOG) is a decentralized meme coin operating on the Bitcoin blockchain. Inspired by the original Dogecoin, \$DOG has carved its niche in the crypto space, attracting a community of enthusiasts and investors. As of the latest data, \$DOG is trading at \$0.001823, boasting a market capitalization of \$182.29 million. The coin has experienced a 21.33% surge from its recent low of \$0.001503, indicating renewed investor interest and bullish momentum. Despite being 81.67% below its all-time high of \$0.009947 in December 2024, the recent uptick suggests potential for recovery. The 24-hour trading volume stands at \$10.18 million, up 34.11%, reflecting heightened trading activity and community engagement. The \$DOG community remains optimistic, with discussions focusing on potential rallies and strategic developments. While past performance has seen fluctuations, the current trend indicates a possible resurgence. Investors are advised to stay informed and consider market dynamics when evaluating \$DOG's potential.

TURBO: The AI-Generated Meme Coin Accelerating in the Crypto Lane

TURBO (\$TURBO) distinguishes itself as the first AI-generated meme coin, merging the realms of artificial intelligence and cryptocurrency. This innovative approach has garnered attention, positioning TURBO as a unique player in the meme coin arena. Currently, \$TURBO is trading at \$0.002188, with a market capitalization of \$150.98 million. The coin has seen a 14,047.4% increase from its all-time low of \$0.00001547 in May 2023, showcasing its explosive growth potential. Despite being 84.76% below its all-time high of \$0.01436 in December 2024, the recent 3.37% surge and a 24-hour trading volume of \$45.65 million (up 31.51%) indicate robust market activity and investor interest. With over 53,000 holders, TURBO's community is rapidly expanding. The integration of AI in its development has piqued the interest of tech-savvy investors and crypto enthusiasts alike. As the project evolves, its unique positioning could lead to further adoption and value appreciation.

Final Thoughts: The Best New Meme Coins to Join Now

Based on our research and market trends, Arctic Pablo Coin, Dog (Bitcoin), and TURBO stand out as some of the top new meme coins to join now. Arctic Pablo Coin presents an unparalleled opportunity with its adventurous narrative, presale structure, and deflationary tokenomics. However, time is running out to get in at the lowest possible price before the next stage takes effect. Investors looking to maximize gains should act quickly before Arctic Pablo Coin's prices rise. Meanwhile, Dog (Bitcoin) is showing renewed bullish momentum, making it a compelling option for traders looking to capitalize on potential price recoveries. On the other hand, TURBO's AI-driven innovation and strong community support position it as a forward-thinking meme coin with long-term promise. For those looking to seize the moment and get ahead of the market, the Arctic Pablo Coin presale is the most exciting opportunity right now. Join the adventure today, stake

your claim in the Arctic Pablo ecosystem, and watch your investment grow! For More Information: - Arctic Pablo Coin: <https://www.arcticpablo.com/> - Telegram: <https://t.me/ArcticPabloOfficial> - Twitter: <https://x.com/arcticpablo> Frequently Asked Questions (FAQs) - What is Arctic Pablo Coin's current presale stage and price? Arctic Pablo Coin is currently in its 14th presale location, Arctic Frosty Falls, with tokens priced at \$0.000074. - How does Arctic Pablo Coin's token burn mechanism work? Unsold tokens from each presale location are permanently burned, reducing the total supply and potentially increasing the value of remaining tokens. - What staking rewards does Arctic Pablo Coin offer? Arctic Pablo Coin offers a staking program with a 66% Annual Percentage Yield (APY), allowing investors to grow their holdings while participating in the ecosystem. - Is Dog (Bitcoin) (\$DOG) a good investment right now? \$DOG has recently gained bullish momentum, with a 21.33% increase from its recent low. However, like all cryptocurrencies, it carries inherent risks, and investors should conduct their own research. - What makes TURBO (\$TURBO) different from other meme coins? TURBO is the first-ever AI-generated meme coin, blending artificial intelligence with cryptocurrency, making it a unique and innovative project in the meme coin space. The crypto market is heating up, and some coins are making serious waves. AAVE is making headlines as Ethereum whales accumulate massive holdings, anticipating a 2,000% price surge. Meanwhile, Stacks (STX) is gaining traction, with its price sitting at \$0.6018 and a market cap of \$912.7M, signaling potential growth. But while these projects ride the momentum, a new player is emerging—Qubetics (\$TICS). Qubetics isn't just another token; it's a game-changer in Real World Asset (RWA) tokenization, bridging the gap between traditional finance and Web3. With an active presale, a weekly price increase mechanism, and projections hinting at 9,206.51% ROI, Qubetics is positioning itself as the next crypto to hit \$1. The question is: can it outshine AAVE and Stacks in long-term value and adoption? Let's dive in. Bridging Web3 & Real Assets: The Power of Qubetics The problem with most crypto projects? They exist in isolation from the real world. Qubetics is rewriting the playbook by launching the world's first Web3 aggregator, designed to unify leading blockchains while bringing tangible assets into the crypto space. Imagine a world where real estate, intellectual property, and commodities are tokenized, allowing businesses and individuals to fractionalize ownership and trade assets efficiently. A small business owner can use Qubetics to tokenize their office space, sell fractional shares, and raise capital without traditional banking barriers. Meanwhile, an artist could tokenize their intellectual property, selling ownership rights on the blockchain while retaining creative control. The potential isn't just theoretical—it's transformative. By removing liquidity barriers and democratizing asset ownership, Qubetics is positioning itself as the next crypto to hit \$1, creating real-world utility that AAVE and Stacks lack. Qubetics Presale: The Next Crypto to Hit \$1 with Insane ROI & Weekly Price Surges Qubetics is currently in its 25th presale stage, with \$TICS priced at \$0.1074. This presale isn't just another early-bird opportunity—it follows a 7-day stage system, where prices increase every Sunday at 12 AM by 10%. Over \$14.9M has been raised, with 22,900+ token holders and 499M+ tokens sold, proving strong community demand. With its rapid growth, many believe Qubetics could be the next crypto to hit \$1 in the coming months. The ROI potential is where things get wild. If \$TICS reaches just \$1, that's an 830.65% return—a level that many presale tokens fail to achieve. But if Qubetics hits \$10 or even \$15 post-mainnet launch in Q2 2025, participants could see a 9,206.51% to 13,859.77% ROI. With such numbers, Qubetics isn't just another presale—it's shaping up to be the best crypto presale for those looking to maximize returns. For example, a \$100 investment today at \$0.1074 gets you 930 \$TICS. If the price hits \$1, that's \$930. At \$10, that's \$9,300, and at \$15, it skyrockets to \$13,950. Few cryptos offer this kind of asymmetric return potential, which is why the Qubetics presale continues to attract early adopters looking for the next crypto to hit \$1. AAVE's 2,000% Prediction: Why Ethereum Whales Are Loading Up AAVE is making headlines after a huge accumulation by Ethereum whales, leading analysts to predict a possible 2,000% surge. With DeFi expanding, AAVE's lending and borrowing ecosystem is seeing renewed adoption. Analysts suggest this could send AAVE's price soaring as liquidity pools grow, and the platform strengthens its dominance in the decentralized finance space. The key driver behind this potential rally is the rise in Ethereum Layer-2 adoption, which directly benefits AAVE. As Ethereum's ecosystem expands, AAVE's role in DeFi lending becomes even more critical. With whale movements aligning with bullish sentiment, AAVE is a strong contender in the next market cycle. Stacks (STX): Price Momentum & On-Chain Growth Stacks (STX) is currently trading at \$0.6018, showing a 0.87% increase in 24 hours, with a market cap of \$912.7M. While the price remains volatile, the total circulating supply of 1.51B STX suggests room for growth. One of Stacks' key strengths is its focus on Bitcoin smart contracts, offering a unique way to interact with the Bitcoin blockchain. This has contributed to its steady adoption, but volume has dropped 34.41% in the past 24 hours, raising concerns about near-term liquidity. The big question: can Stacks break past the \$1 mark? While it has strong fundamentals, it faces stiff competition from projects with higher liquidity, broader adoption, and unique tokenomics—a space where Qubetics seems to have an upper hand. Which Crypto Has the Best Upside? AAVE has strong backing from Ethereum whales, and Stacks is leveraging Bitcoin's security for smart contracts. But when it comes to real-world use cases, accessibility, and presale potential, Qubetics stands out. With a weekly price increase mechanism, real-world asset tokenization, and a massive ROI potential, it's no surprise that Qubetics is being called the next crypto to hit \$1. If you're looking for a high-upside opportunity, it might be time to join this crypto presale before the next price jump. For More Information: - Qubetics: <https://qubetics.com> - Presale: <https://buy.qubetics.com/> - Telegram: <https://t.me/qubetics> - Twitter: <https://x.com/qubetics> FAQs 1. Is Qubetics the next crypto to hit \$1? Qubetics' real-world asset tokenization and unique presale model make it a strong candidate to reach \$1, especially with its 830.65% ROI potential. 2. How does

Qubetics compare to AAVE and Stacks? While AAVE benefits from Ethereum's DeFi expansion and Stacks integrates with Bitcoin, Qubetics offers real-world asset tokenization, a game-changer in crypto adoption. 3. When does the Qubetics presale end? Qubetics' presale follows a 7-day stage system, with prices increasing every Sunday at 12 AM until the mainnet launch in Q2 2025. Alt Text: next crypto to hit \$1, best crypto presale, Qubetics presale, top crypto presale, AAVE price prediction, Stacks STX price update, Qubetics tokenization, crypto presale 2025, AAVE Ethereum whales, best new crypto Disclaimer: TheNewsCrypto does not endorse any content on this page. - Bitcoin dominance surged to 62% today. - Crypto trading volume declined 15% and market cap surged only 1.77% in the last 24 hours. The crypto market shows slight recovery today as the Bitcoin price increased by around 2%. From the lows of \$76K yesterday, Bitcoin price surged past the \$80K and is currently trading in the \$83K range. The overall crypto market cap increased by 1.77% and its value is hovering at \$2.71 trillion. As per the chart, Bitcoin dominance surged to 62% today. When the crypto market was on a short bull run, Bitcoin dominance dropped to a year-low of 55%. That time, Bitcoin reached an all-time high and several altcoins recorded significant price surges. However, the crypto market is weak at present and altcoins are struggling to keep up with their slight price surges. The overall crypto market trading volume declined by a significant 15% in the last 24 hours. Its value used to record around \$420 billion during peak market times. However, the daily trading volume is only \$101.28 billion at present. This reflects trader exhaustion and weakening market momentum, which could bring more losses. What's Ahead for Bitcoin in the Coming Weeks? The global macroeconomic concerns are influencing the crypto market at present. Increasing trade tensions as a result of Trump's new tariffs and recession fears are making traders cautious of risky investments. Despite the Trump administration moving forward crypto regulation and Bitcoin reserve creation, the industry doesn't seem to be bullish. Meanwhile the crypto fear and greed index records a 21, indicating fear sentiment across the market. If this continues, we might see further downturn of the crypto market in the coming weeks. In the absence of a significant catalyst that could push the crypto market, BTC price would fall again to the \$70K price range. Highlighted Crypto News Today:

Cryptocurrency is no longer a niche investment choice, but an increasingly mainstream opportunity. The journey for many starts with learning about the best cryptos for beginners, and this article will delve into three noteworthy cryptocurrencies: Qubetics, Sonic (formerly Fantom), and Bitcoin Cash. Each of these projects offers unique value propositions for backers, participants, and early adopters looking for exciting, secure, and scalable options in the blockchain space. While Bitcoin Cash has seen steady support among digital finance enthusiasts, Sonic's rebranding from Fantom represents a significant evolution, and Qubetics is making waves with its promising presale figures. This article will take a closer look at why these three cryptos are gaining traction among new and experienced community members alike, offering an insightful view into their current standing in the market. At the forefront of innovation, Qubetics addresses challenges that have plagued blockchain systems, focusing on real-world applications and delivering solutions where previous projects have fallen short. The Qubetics presale has already raised substantial funds and has become a hot topic among early adopters, signaling its potential for long-term success. Qubetics: A New Era in Blockchain and Digital Finance Qubetics (\$TICS) is a blockchain project that is revolutionizing the way cross-border transactions are handled. It aims to simplify and streamline financial transactions for businesses, professionals, and individuals, providing a much-needed solution to the complexities of international money transfers. As one of the best cryptos for beginners, Qubetics makes it easy for anyone to participate in the global economy without the usual barriers associated with traditional financial systems. Currently, the crypto presale is in its 25th stage, and more than 499 million \$TICS tokens have been sold, raising over \$14.9 million from more than 22,900 holders. This ongoing presale offers \$TICS at \$0.1074, with analysts predicting a price surge to \$0.25 by the end of the presale, which translates into a potential ROI of 132%. Furthermore, once the presale concludes, Qubetics could see significant price increases, with forecasts predicting a value of up to \$10 per token after the mainnet launch, delivering a jaw-dropping 9,206% ROI. The Qubetics presale has generated significant buzz due to its impressive performance and the token's projected growth. With its focus on solving real-life problems, such as cross-border payment challenges, Qubetics stands out as a promising addition to any crypto portfolio. In fact, some analysts are predicting that \$TICS could hit \$1 post-presale, offering a potential ROI of 830%. Even more exciting is the forecast for \$5 per token, which would yield a staggering 4,553% ROI, and some projections even place \$TICS at \$15 after the mainnet launch. This immense growth potential makes Qubetics one of the most talked-about cryptocurrencies for early adopters and those seeking high returns. The presale's success is a testament to the increasing demand for efficient, scalable solutions in the digital finance sector. Sonic: The Rebranding of Fantom for Scalability and Speed Sonic (formerly Fantom) has recently undergone a significant rebranding, emerging as one of the best cryptos for beginners. With its enhanced scalability and high-performance features, Sonic offers something for those looking to dive into the world of decentralized finance (DeFi) and blockchain technology. Its infrastructure is capable of processing 10,000 transactions per second with sub-second finality, making it an ideal choice for anyone seeking a fast, reliable, and secure crypto platform. By being compatible with both Solana Virtual Machine (SVM) and Ethereum Virtual Machine (EVM), Sonic brings versatility to developers and participants. Whether you're looking to build dApps or explore DeFi opportunities, Sonic provides the tools and technology to support various projects, making it one of the most accessible cryptos for beginners. Bitcoin Cash: Resilience in a Tumultuous Market Bitcoin Cash (BCH) has proven its resilience over the years, particularly when compared to Bitcoin's price movements. BCH recently faced a 5% dip but managed to stabilize above the \$345 mark, showcasing its strength in the face of market downturns. While Bitcoin

experienced a sharper loss of 8%, BCH held steady, making it an appealing option for backers seeking a relatively stable alternative to more volatile coins. Despite the short-term pullback, BCH has demonstrated strong support at key price levels, and its ongoing market presence continues to attract participants looking for opportunities in the world of digital assets. Whether you're new to crypto or a seasoned participant, Bitcoin Cash remains one of the best cryptos for beginners due to its established track record and continued network development. Conclusion: Get in Early, Reap the Rewards

When it comes to the best cryptos for beginners, Qubetics, Sonic, and Bitcoin Cash each bring something unique to the table. Qubetics is paving the way for a new era of cross-border transactions, Sonic is providing unparalleled scalability and performance, and Bitcoin Cash remains a stronghold of stability in a volatile market. Whether you're looking to take part in a promising presale, explore new blockchain solutions, or simply diversify your digital portfolio, these three projects offer incredible opportunities for backers, participants, and early adopters alike. Don't miss out on the chance to be part of the next big thing in blockchain technology. As the market continues to evolve, these cryptos are well-positioned for long-term success. For More Information: - Qubetics: <https://qubetics.com> - Presale: <https://buy.qubetics.com/> - Telegram: <https://t.me/qubetics> - Twitter: <https://x.com/qubetics> FAQs - What makes Qubetics a good choice for beginners? Qubetics offers a user-friendly platform with easy access to cross-border transactions and a clear roadmap for growth, making it ideal for beginners who want to get started with a blockchain solution that provides real-world utility. - How does Sonic differ from other blockchain platforms? Sonic stands out due to its compatibility with both Solana and Ethereum Virtual Machines (SVM and EVM), offering versatility and scalability that other platforms may lack. Its high performance makes it a great option for participants looking for speed and reliability. - Why is Bitcoin Cash considered stable? Bitcoin Cash has demonstrated stability by maintaining support at key price levels even during market downturns, unlike more volatile cryptocurrencies. This resilience makes BCH an appealing choice for backers seeking a steady investment in crypto. - How can I participate in the Qubetics presale? The Qubetics presale is currently in its 25th stage, and participants can buy \$TICS tokens at \$0.1074. This presale offers an opportunity for early adopters to benefit from potentially high returns once the mainnet launches. - What is the expected ROI for \$TICS tokens? Analysts predict that \$TICS could offer substantial returns, with projections suggesting a price of \$0.25 by the end of the presale, and \$1 after the presale, offering an 830% ROI. After the mainnet launch, prices could rise to \$10 or even \$15, leading to returns of up to 13,859%. Disclaimer: TheNewsCrypto does not endorse any content on this page. The crypto market's volatility has investors scrambling for stability amid Bitcoin's recent pullback from all-time highs. While BTC experiences a correction phase, XRP secures regulatory wins, positioning it for institutional adoption. PEPE navigates challenges after Binance's recent action, BitLemon (\$BLEM) is creating unprecedented buzz with its Stage 2 presale nearly 90% sold out and a revenue-generating platform already live, offering potential returns of up to 900% from current prices to projected listing. Is \$BLEM's 90% Presale Sellout The Biggest Opportunity You're Missing? BitLemons is disrupting the \$450 billion traditional casino market with its revolutionary GambleFi protocol. The fully functional crypto casino features over 8,000 games from premium providers like Evolution and Pragmatic, generating actual revenue 24/7. An impressive \$1.89 million has already been raised, and the Stage 2 presale is 90.49% sold out. Investors are racing to secure positions with only 3,109,430 BLEM tokens remaining at the current \$0.02 price point before the imminent increase to \$0.03 in Stage 3 (just 7 days away). The platform's three exclusive original games—\$BLEM Kenô, Crash by BitLemons, and Wheel of BitLemons—generate higher margins by eliminating third-party GGR payments, while the tokenomics allocate 30% of all gaming revenue to token holders through buybacks and staking rewards. Why Is Wall Street's Bitcoin Adoption Failing To Prevent Market Corrections? Despite institution-friendly ETFs and endorsements from figures like Paul Tudor Jones, Bitcoin has retreated to \$77,036.89, down 5.20% as traditional finance's entry has paradoxically introduced greater volatility. Many expected institutional adoption would eliminate major corrections, but the opposite has occurred. Wall Street traders' trading patterns differ fundamentally from those of Wall Street traders who focus on shorter timeframes and liquidity-taking strategies. While long-term fundamentals remain strong, Bitcoin's correlation with traditional markets has increased, making it increasingly vulnerable to macroeconomic factors rather than functioning as the "digital gold" hedge many early adopters envisioned. Will XRP's New Licensing Push It To Long-Awaited Price Breakout? XRP has demonstrated remarkable resilience amid broader market turbulence. Ripple's expanding U.S. operations through strategic licensing acquisitions position the cryptocurrency for institutional adoption. Currently trading at \$1.95, XRP has maintained critical support levels despite Bitcoin's correction. Expanding Ripple's regulatory-compliant operations signals growing acceptance within traditional finance circles, potentially driving significant utility-based demand. Technical indicators suggest XRP is coiling for a potential breakout, with the \$2.50 level representing the next major resistance. Has PEPE's Binance Delisting Created A Buying Opportunity Or Warning Sign? PEPE's recent delisting as a borrowable asset on Binance has created mixed sentiment around the popular meme coin. Currently trading at \$0.0055398, PEPE has experienced increased volatility as traders assess the implications of this exchange action. Despite this setback, PEPE's community remains one of the most engaged in crypto, with social media metrics showing sustained interest despite price fluctuations. Market watchers remain divided on PEPE's outlook, with some pointing to previous exchange actions that temporarily impacted prices before reversals. Is \$BLEM's Revenue-First Model The Future of Crypto Investment? While Bitcoin, XRP, and PEPE all present distinctive investment cases, none matches BitLemons' unique combination of existing revenue generation, explosive growth potential, and investor-focused tokenomics. Dual security audits from SpyWolf and

SolidProof provide an additional layer of investor protection rarely seen in presale projects, making \$ BLEM stand apart from the competition. For investors seeking the optimal balance of immediate potential, sustainable growth, and verifiable revenue, BitLemons represents the standout opportunity in today's crypto landscape. The only question remaining isn't whether to invest "it's how much to allocate before the price inevitably increases. This has just been announced, win 50,000 USD in BitLemons's \$1M giveaway"invest just \$50 to enter! - Website: <https://presale.bitlemons.io/> - Socials: <https://linktr.ee/bitlemons> [Disclaimer: This is a sponsored article and is for informational purposes only. - Starknet plans to expand Bitcoin use cases by bridging Bitcoin and Ethereum. - StarkWare recently established a Bitcoin strategic reserve. StarkWare seems to have bigger plans for Bitcoin despite the weak crypto market. It joined the growing list of firms that have established a Bitcoin strategic reserve. On the other hand, Starknet plans to bridge two major blockchains, Bitcoin and Ethereum, on a single layer 2 network. The firm is making headlines with this remarkable initiative. Starknet is an Ethereum layer2 network developed by StarkWare. Despite being developed on the second-major blockchain, Ethereum, the firm has been focusing on Bitcoin research for a while now. The Starknet Foundation recently published a Bitcoin Roadmap and outlined its ambitious plans for Bitcoin. Starknet Unveils Bitcoin Development Plans Starknet CEO Ben-Sasson not only perceives Bitcoin as a mere store of value, he looks at the enormous potential it holds for real-time utility. To bring this vision forward, the firm revealed several plans they have for the Bitcoin blockchain. A Bitcoin wallet called Xverse is going to integrate with Starknet and allow users to access Bitcoin assets such as Ordinals on its network. Its Foundation is launching the "BTCFi Season" to offer yield opportunities on Bitcoin through the network. The initiative aims to bring DeFi use cases to Bitcoin holders. Starknet also aims to become the first layer 2 network to unify two major blockchains, Bitcoin and Ethereum. The firm believes Bitcoin is limited to a store of value, and it proposes to be the execution layer for Bitcoin blockchain. Once the firm achieves its vision, it could open doors to numerous possibilities. Ethereum co-founder Vitalik Buterin also supported Starknet's plans regarding Bitcoin. Lack of scalability is one of the major issues of Bitcoin blockchain, and Starknet aims to change that with its plans to bridge Bitcoin with Ethereum. Highlighted Crypto News Today: HYPE Token Drops as Whale Liquidation Triggers \$4M HLP Vault Loss

- Metaplanet has raised 2 billion yen through an interest-free bond to expand its Bitcoin portfolio. - The company has recently acquired 162 more Bitcoin for its treasury. Japanese investment company Metaplanet Inc. has said it plans to sell 2 billion yen, or about \$13.4 million worth of interest-free regular bonds as part of its approach to acquiring Bitcoin. The action makes Metaplanet one of Asia's largest corporate Bitcoin owners in a repeat of strategies first set by U.S.-based MicroStrategy. Significantly, Metaplanet's Board of Directors approved the issuance of its 8th Series of ordinary bonds. The entire bond issuance is being allocated to EVO FUND. Each bond carries a face value of 50 million yen, and bondholders are allowed early redemption options. The bonds are set for full redemption on September 11, 2025. Also, it aims to minimize the company's debt service burden. To manage repayment, Metaplanet plans to exercise its 14th to 17th stock subscription rights. Bitcoin Treasury Surpasses 3,000 BTC With the latest Bitcoin Treasury Operations, Metaplanet recently acquired an additional 162 BTC at an average purchase price of 12,393,669 yen per Bitcoin. Following this acquisition, the firm's Bitcoin reserve now stands at 3,050 BTC. Conversely, Metaplanet has placed a very aggressive goal for its Bitcoin buying plan. The company plans to accumulate 10,000 BTC by the year 2025 and eventually achieve 21,000 BTC by 2026. Furthermore, by issuing interest-free bonds and leveraging Japan's low-interest rate environment, Metaplanet is employing a strategy similar to that of MicroStrategy, rebranded as Strategy. Metaplanet's strategy has led to it being dubbed the "Asian MicroStrategy." Ever since April 2024, the company has continually added to its Bitcoin reserves, making it a leading institutional player in the digital assets space. Besides, the biggest asset, Bitcoin, has been on the bear wave for the past few days. BTC spiked by 1% at press time, trading at \$82.3K. Daily trading volume has plunged by 20.21% to \$47.27 billion. Highlighted Crypto News

- Bitcoin spikes 5.48% yesterday, trading at \$81,820 with a \$1.62 trillion market cap. - Broader market rally fueled by Bitcoin Act Bill and US-Ukraine ceasefire agreement. Major cryptocurrencies, along with Bitcoin and Ethereum, showed positive movement as the broader market started to recover. The crypto market capitalization stands at \$2.65 trillion while showing a 2.73% increase during the previous 24 hours. The market recovery may be indicated by this recent upward trend. Bitcoin's price spiked by a phenomenal 5.48% yesterday, with the price opening at \$78,599 and touching a high of \$83,568. Later, the price closed at \$82,869. According to CoinMarketCap data, the Bitcoin market value stands at \$81,820 while showing a 2.08% increase in its daily price, which signals positive market sentiment. The daily trading volume decreased by 19.06%, while the volume-to-market ratio reached 2.9%. The market capitalization stands at \$1.62 trillion and the daily trading activity reaches \$47.7 billion. Besides Bitcoin, XRP and Cardano also showed uptick. XRP price took a bounce from its lower support of \$1.897 and touched a high of \$2.213, a 7.51% intraday surge. On the other hand ADA also showed some remarkable surge with a 7.93% of change. It took a bounce from \$0.6472 and reached a high of \$0.7450, according to Tradingview data. Why the Market Bounced Back? There are several catalysts behind the broader market recovery. On March 11, Senator Cynthia Lummis reintroduced the Bitcoin Act Bill in the US Congress which aligns with President Trump's promise. And just before the White House Crypto Summit, Trump had already signed an order to create a "Strategic Bitcoin Reserve." Another

reason is that Ukraine has agreed to a United States offer for a 30-day ceasefire in its war with Russia. All these became a catalyst for the broader market rally in the last 2 days. Highlighted Crypto News Today:

- Germany's Deutsche Boerse has announced launching Bitcoin and Ether Institutional Custody. - There has been a surge in crypto adoption across Europe over the past few months. The recent market crash has sparked tremendous debate within the digital assets community. While most take a negative outlook, a few members such as asset manager Ark Invest CEO Cathie Wood have a varied perspective. Wood believes that this could be the final leg of a rolling recession, meaning upward movements could follow. On the other hand, Europe has been growing its crypto adoption irrespective of current market conditions. Notably, Germany-based exchange group, Deutsche Boerse announced plans to launch a Bitcoin and Ether institutional custody. Through this venture, Deutsche's trading unit Clearstream aims to enhance its user experience for institutional clients. The firm also will include settlement services for Bitcoin and Ether transactions for its 2500 institutional clients. Jens Hachmeister, Clearstream's Issuer Head stated: "With this offering, we are creating a one-stop shop around custody, brokerage and settlement," Moreover, in order to facilitate this process, Clearstream is partnering with Deutsche Boerse's Switzerland-subsidary Crypto Finance AG. The exchange group also plans to expand services to include staking, lending, and brokerage capabilities in the future. Is Germany's Deutsche Boerse an Indication of European Adoption Surge? Over the past two months, there has been a surge in crypto adoption on a global level. Deutsche Boerse's recent venture stands testimonial to this recent shift in attitude towards crypto assets particularly within Europe. Moreover, Germany also recently saw its Ex-Finance Minister, Christian Linder push for a Bitcoin adoption in the country. Previously, in July 2024, the German government sold 50K BTC tokens that were seized in a cryptocurrency fraud. Another prominent German bank, Commerzbank also initiated Bitcoin and Ethereum trading in September 2024. While the nation still receives criticism for its July BTC sale, recent positive instances might shift community members' perspectives. Highlighted Crypto News Today: Arkham token ARKM Surges 14% Following Upbit Listing Amid Market Slump

- Mt. Gox moved 32,371 BTC (\$2.19B) to new wallets, its largest monthly transfer. - Bitcoin trades at \$80,378, down 2.51%, with resistance at \$85,000 and support at \$78,000. Defunct crypto exchange Mt. Gox moved 32,371 BTC (\$2.19 billion) to new wallets on Monday, marking its largest transfer in months, according to Arkham Intelligence. The movement has sparked speculation about potential creditor repayments. Most of the Bitcoin 30,371 BTC was sent to wallet "1FG2Câ€¦Rveoyâ€", while 2,000 BTC initially landed in Mt. Gox's cold wallet before being moved to an unmarked address. Last week, the exchange transferred 500 BTC to two unknown wallets. The reason for these transfers remains unclear. However, past movements have often preceded repayments through centralized exchanges such as Bitstamp and Kraken. Some analysts believe this could be an early step toward reimbursing creditors, while others suggest Mt. Gox may be testing wallets before larger distributions. The recent transfers come after the exchange postponed its creditor repayment deadline from October 31, 2024, to October 31, 2025. Originally, Mt. Gox planned to distribute 141,686 BTC among creditors, but delays have caused frustration. The trustee previously cited operational and security concerns for the postponement. Bitcoin in Today's Market At the time of writing, Bitcoin trades at \$80,378.74, down 2.51% in 24 hours. The market cap has fallen to \$1.59 trillion, while trading volume surged 51.27% to \$59.57 billion. Bitcoin faces resistance at \$85,000, with support at \$78,000 and \$75,000. The RSI at 37.97 signals oversold conditions, while a Chaikin Money Flow (CMF) of -0.04 indicates weak buying pressure. Mt. Gox's latest Bitcoin transfers have reignited speculation about creditor repayments, though no official announcement has been made. Mt. Gox collapsed in 2014 after losing 850,000 BTC to a hack, making it one of the largest failures in crypto history. In recent years, the exchange has recovered around 200,000 BTC, which is set to be repaid to creditors. However, the timeline remains uncertain. Highlighted Crypto News Today How Low Could Ethereum (ETH) Drop in the Next 7 Days?

- Bitcoin has factored in a modest price drop of 2.39% in the last 24 hours. - The cryptocurrency tested a support level of \$76,707 in the past day as per CMC data. While community members raise havoc by watching their largest profits disappear, analysts remain positive. Over the past few weeks, several experts had predicted that Bitcoin and the alt sector would retract the bull run before bouncing back up. As this materializes into reality, speculations of a bigger cycle arise. Notably, in the last 24 hours, Bitcoin has factored in a modest price drop of 2.39%. This drop, however, caused it to break the \$80,000 support in the late evening hours of March 10. Presently, the cryptocurrency is dabbling across the \$79K - \$80K border. However, as aforementioned analysts predict further dips. Inferring its daily price chart, Bitcoin depicts combating the \$82K resistance in the morning hours of March 10, after which it gave in to bears. Its intra-day low stands at \$76,707, meanwhile, experts such as Arthur Hayes field mark \$69,000 as the next key support. At the time of writing, BTC was trading at \$80,277 as per CMC data. Moreover, Ali also outlined how the third year of a bull run tends to be unpredictable from historic data. He stated that the year tends to hold uncertainty, volatility, and big shakeouts, on the other hand, traders who navigate it tend to land profits. Is the Bitcoin Drop Part of a Bigger Bull Cycle? Multiple market experts including the aforementioned have viewed the recent dip as essential for an incoming rebound in Bitcoin price. In case of further downward movements, the digital asset might test support levels of \$76,496 and \$74,785 in the coming days. With the current movements mirroring experts' predictions, this recent move might be part of a bigger bull cycle. Additionally, Bitcoin's bear power indicator value stands at -5.07 while the bull power indicator stands at 0.69. This further confirms the bearish market dominance. The resultant sell-offs have caused the RSI value to dip to 35.55 as per TradingView data. Finally, the largest cryptocurrency's price drop can be seen reflected in other altcoins such as Ethereum and Solana.

Bitcoin and Shiba Inu have long dominated headlines as icons of the crypto revolution. Bitcoin, the

undisputed pioneer, turned early adopters into millionaires. Shiba Inu, the playful meme token, skyrocketed to fame with its viral growth and meme-fueled momentum. But ask any experienced investor, and they'll tell you "these giants have had their time. The spectacular returns they once offered are now a thing of the past. If you're hunting for a life-changing opportunity in cryptocurrency, look beyond yesterday's successes. Let's talk about BinoFi (BINO), the rising-star token that could eclipse the golden days of its predecessors. Cryptocurrency prizes innovators, and BinoFi is proving to be just that, a player set to shake up the way we trade and invest in digital assets. Analysts are beginning to whisper about its potential for exponential returns, with some suggesting it could transform a modest \$5,000 investment today into half a million dollars by the close of 2025. Daring? Sure. But there's a growing case for why this hybrid crypto exchange and ecosystem might just live up to the buildup. A Fresh Start with Proven Innovation What sets BinoFi apart is its raw potential and wide-reaching vision. At a time when the crypto market is full of fragmented trading systems and security concerns, BinoFi steps in to bridge the gaps. Its hybrid exchange model borrows the speed and liquidity of centralized platforms and pairs them with the transparency and user autonomy of decentralization. Yet, this isn't simply another evolutionary step—it's a reimagining of what trading can and should be. Beyond sophisticated trading mechanics, BinoFi introduces meaningful usability upgrades. Its Multi-Party Computation (MPC) wallets, for instance, balance security with simplicity, eliminating barriers that scare off everyday users. BinoFi's cross-chain functionality, allowing direct asset swaps across separate blockchains without bridges, feels less like an upgrade and more like a complete reinvention of interoperability. This is where investors see a spark reminiscent of Bitcoin's early days or Shiba Inu's youthful rise, a project that isn't simply catering to the market but leading it toward its next frontier. And that's enough to ignite imagination and excitement, especially during a time when top tokens feel more like slow, lumbering institutions than explosive opportunities. The Presale That's Turning Heads A central piece of BinoFi's story lies in its presale—a bold entryway into the market designed not just to raise funds, but to prime early adopters for extraordinary gains. Savvy crypto investors know that presales can offer a golden ticket. With lower prices and exclusive perks, they provide a rare opportunity to invest in a token before it hits the major exchanges and gains mainstream attention. For BinoFi, this moment represents more than an early-stage token offering. It's a statement—this project isn't here to blend in. It's here to dominate. The presale is structured to attract long-term investors, offering substantial bonuses and incentives for early contributors. These aren't just empty gestures but designed to ensure compounding benefits for participants who join during its infancy. Importantly, the presale also reflects the project's commitment to long-term growth, with detailed mechanisms to stabilize the token price and foster trust. Industry whispers suggest major institutional players are eyeing the presale, which underscores its significance. And with incentives aimed at rewarding the first movers, smaller retail investors have a distinct advantage if they act quickly. Predictions Heading Toward 2025 Fueled by its hybrid technology, unique trading model, and a rising demand for decentralization and interoperability, analysts predict rapid adoption once the token is fully launched. Early estimations suggest a valuation that could rival mid-cap cryptocurrencies within two years, with a trajectory that mirrors the meteoric initial growth of projects like Solana. By 2025, investor models project BinoFi hitting milestones that would make current prices seem laughably low. Its current entry point, accessible to practically any retail investor, offers the kind of upside rarely seen since Bitcoin's days. But raw profits aside, what really drives these predictions is the ecosystem itself. BinoFi isn't being built as a trendy, hyped-up token, it's being designed as a critical infrastructure layer that could quietly and consistently power an overlooked corner of the crypto market. This is how the biggest winners emerge, not by copying trends but by creating them. Why Timing Matters Anyone who has watched the crypto space long enough knows that timing is everything, Bitcoin in 2011, Ethereum in 2014 and Solana in 2020. Miss those moments, and your portfolio reflects the difference. BinoFi's current stage feels just like one of those pivotal market moments. It's in its infancy—underpriced, under-hyped, but undeniably positioned to capitalize on massive structural changes across the industry. The question isn't whether BinoFi will grow, but how far. For investors still waiting on the sidelines, this moment might well be the last stop before BinoFi's trajectory takes off into uncharted heights. - Website: <https://binofi.com> - Whitepaper: <https://whitepaper.binofi.com> - Telegram: <https://t.me/binofilabs> - Twitter: <https://x.com/Binoficom> - CoinMarketCap: <https://coinmarketcap.com/currencies/binofi/> Disclaimer: TheNewsCrypto does not endorse any content on this page. - SGX will launch Bitcoin perpetual futures in H2 2025 for institutional clients. - The offering is pending approval from the Monetary Authority of Singapore. Singapore Exchange Ltd. (SGX) plans to launch Bitcoin perpetual futures in the second half of 2025. The offering will cater exclusively to institutional clients and professional investors. Retail traders will not have access, according to a Bloomberg report. The planned contracts are still awaiting regulatory approval from the Monetary Authority of Singapore. Unlike traditional futures, perpetual contracts have no expiration date. They allow traders to speculate on Bitcoin's price movements continuously. This move aligns with the broader trend of traditional exchanges embracing crypto derivatives. Japan's Osaka Dojima Exchange Inc. is also seeking approval to list Bitcoin futures. Institutional interest in cryptocurrency is increasing, particularly amid pro-crypto policies from the U.S. government. Expanding Institutional Crypto Access SGX's spokesperson stated that the exchange expects its offering to "significantly expand institutional market access." The initiative may also help address credit risks tied to unregulated platforms like Binance and OKX. Offshore exchanges currently dominate the perpetual futures market, but SGX aims to bring regulatory oversight to this space. Singapore has positioned

itself as a key hub for cryptocurrency businesses. Regulatory clarity and institutional-friendly policies have attracted firms seeking a compliant market. Robinhood Crypto is also expanding its presence in Singapore. The company acquired Bitstamp for \$200 million in 2024 and aims to launch crypto services in the country by late 2025. Bitstamp received in-principle approval from Singapore's regulators last year. The exchange will act as a gateway for Robinhood's entry into the Singaporean market. With more financial institutions embracing crypto, SGX's move strengthens its role as a bridge between traditional finance and digital assets. The exchange's Bitcoin perpetual futures could offer institutions a secure alternative to unregulated derivatives markets. If approved, the offering will likely attract major trading firms seeking compliance and security in crypto investments. Highlighted Crypto News Today Unknown Attack on Pectra Upgrade Further Delays Launch on Mainnet

- Spain's second-largest bank, BBVA, has secured approval to offer Bitcoin and Ether trading. - The move aligns with the shift in European banking as institutions race to comply with MiCA regulations. Spain's banking giant Banco Bilbao Vizcaya Argentaria (BBVA) has been approved by the country's securities regulator, the Comisi3n Nacional del Mercado de Valores (CNMV), to offer Bitcoin (BTC) and Ether (ETH) trading services. BBVA now will allow clients to buy, sell, and manage digital assets directly through its official mobile banking app. Unlike third-party crypto platforms, the bank will provide custody services using its own cryptographic key management system. Initially, access will be limited to select users before rolling out to all private clients in the coming months. BBVA is valued at around \$840 billion, and this expansion follows a trend of traditional financial institutions moving into the crypto space. Now that regulations around digital assets are solidifying, major banks are already positioning themselves to satisfy the growing demand for secure crypto services. A Strategic Expansion Historically, BBVA's crypto journey began in Switzerland. In 2021, the bank introduced Bitcoin trading and custody services for private banking clients under the Swiss Financial Market Supervisory Authority (FINMA). Later, it expanded those offerings to include Ethereum and the USDC stablecoin. In January 2024, BBVA took another decisive step by launching crypto trading in Turkey through its subsidiary, Garanti BBVA Kripto. Now, with regulatory approval in Spain, the bank continues to widen its crypto recognition across Europe. Meanwhile, BBVA has been preparing for this expansion since 2020 but waited for clearer regulations and a healthy crypto environment. With Spain now on board, the bank is strengthening its position as a leader in crypto adoption within traditional finance. MiCA Compliance Fuels Institutional Crypto Adoption BBVA's approval comes at the right time, as the European Union's Markets in Crypto-Assets (MiCA) regulation is now fully in effect. This will bring a structured framework to digital asset services across the region. While companies have until July 2026 to achieve full compliance, many financial institutions are moving quickly to align with the new standards. Since MiCA's rollout, both traditional banks and crypto-native firms have been racing to secure regulatory approval. For instance, Hidden Road obtained its MiCA license in the Netherlands, while Standard Chartered received approval in Luxembourg, and Boerse Stuttgart Digital Custody became Germany's first MiCA-licensed crypto service provider in January. Crypto exchanges are also adjusting. OKX, Crypto.com, and HashKey all secured MiCA approval earlier this year. Meanwhile, Bybit, which suffered a record-breaking hack, recently made headlines by getting removed from France's blacklist as it works toward regulatory compliance. BBVA's move signals that mainstream banks are no longer sidelining crypto. Instead, they're integrating it within traditional banking services, making digital assets more accessible to everyday investors. Highlighted Crypto News for Today Arkham Report: WLF Portfolio Sinks and Ethereum Buys in Major Loss

- The Utah government has become the first to pass a Bitcoin bill soon to become law. - Bitcoin has fallen once again to the \$82K level in the last 24 hours. While the crypto market has receded to the bearish end over the weekend, community members seem to have come to terms with it. Bitcoin has slid to the \$82K level and external factors appear to not suffice as propellants. However, the sector itself has not gone dormant, as activity is still on the upward direction. Notably, a few hours ago, the US State of Utah announced news of a Bitcoin bill, which caught market attention. According to the bill, it creates authority to the state treasurer for investing in digital assets. Furthermore it also prohibits state entities to restrict acceptance or custody of digital assets. Following several other US states, Utah is the latest to join in line to authorize state government investments in Bitcoin and the other digital assets. However, the bill failed to include an amendment that would allow the state treasurer to invest in Bitcoin. Moreover, this amendment would have made Utah the first state in the US to actually pass a Bitcoin Reserve bill. However, currently, it only provides basic custody protections for Utah citizens. The aforementioned amendment would have allowed the state treasurer to invest up to 5% in Bitcoin. Why Did the Utah Senate Deny Rights of Bitcoin Investment? According to reports, the reserve clause passed the second reading but was removed before the third and final reading. However the bill has been passed and is now headed to the Governor for being converted into law. Meanwhile, Bitcoin, as aforementioned, has remained in the \$82,000 range for the past day. It has factored in a drop of 4.23% in the last 24 hours to reach the current level. At the time of writing, BTC was trading at \$82,196 as per CMC data. On the other hand, the Canadian nation's new Prime Minister, Mark Carney's once uttered negative views on Bitcoin seem to have caught market attention. Community members are wondering if this might result in Canada's crypto landscape shifting. Highlighted Crypto News Today: 600K Ethereum Withdrawn From Exchanges in the Last 7Days - How Will It Impact ETH?

- Bitcoin must stay above \$82K to avoid \$1.13 billion in liquidations and increased volatility following Bitcoin reserve - Investor sentiment weakened after Trump's Bitcoin reserve plan excluded new BTC purchases. - Upcoming U.S. economic data, including CPI and job reports, could impact Bitcoin's price. The price trajectory of Bitcoin is in danger as it hovers around the critical \$82,000 support level. Analysts warn that a weekly close below this level can trigger over \$1.13

billion worth of leveraged long liquidations on exchanges. Which is leading to heightened volatility for the crypto market. Trump's Bitcoin Reserve and Market Reaction The recent price weakness follows an executive order signed by then U.S. President Donald Trump on March 7. The order outlined proposals to establish a U.S. Strategic Bitcoin Reserve using seized Bitcoin from criminal cases. This move disappointed investors who were eagerly awaiting outright federal Bitcoin purchases as a demonstration of institutional endorsement. Bitfinex analysts stated that the lack of active government investment led to short-term bearish sentiment, contributing to the decline in Bitcoin's price. "Investors wanted federal accumulation to be a sign of robust institutional support, maybe to push prices higher. But using holdings that are based on today allowed expectations to remain in check," Bitfinex analysts explained. Macroeconomic Developments Other than the regulation decisions, Bitcoin's price is still influenced by macroeconomic developments. Nexo analyst Iliya Kalchev mentioned that Bitcoin's short-term prices will be influenced by future U.S. releases. Everyone will be holding their breath next week for the Consumer Price Index (CPI) and job openings report. Those numbers will inform us of inflation trends and labor market health, and that will be something that will influence investor sentiment," Kalchev said. If inflation slows down and labor market conditions worsen, expectations for interest rate cuts could increase, which would be beneficial for Bitcoin as a diversification vehicle. Alternatively, stronger-than-anticipated economic news may continue to place downward pressure on the price of Bitcoin. Technical Indicators Despite the bearishness, some technical indicators say that Bitcoin is near a local bottom. Relative Strength Index (RSI), or a measurement of whether or not an asset is overbought or oversold, reads 28 on the daily chart. Historically, whenever the RSI for Bitcoin is around this number, the price bottomed or came within 2%–8% of doing so. If Bitcoin ends the week higher at above \$82,000, it can send a message to change sentiment and help mend investor confidence. But a break below will bring more volatility to the lower side, and so traders and investors hold their breath for that to happen. As the market is processing Trump's reserve approach to Bitcoin and macroeconomic developments. Thus, everyone sits and waits and observes if Bitcoin maintains its critical support level for the next several days.

Reflecting on Bitcoin's inception, one might wonder: what if the opportunity to invest in its early stages had been seized? Launched in 2009 by the pseudonymous Satoshi Nakamoto, Bitcoin introduced the world to decentralized digital currency. Initially, Bitcoin had no monetary value, with early transactions involving the exchange of thousands of bitcoins for minimal goods, such as the famous purchase of two pizzas for 10,000 BTC in 2010. The cryptocurrency market continually presents new opportunities for those who missed out on Bitcoin's meteoric rise. One such prospect is Qubetics, a project that aims to revolutionize the crypto experience with its innovative solutions. As the digital asset landscape evolves, identifying the best cryptos to buy this month becomes crucial for investors seeking substantial returns. Qubetics: A Modern Solution with Its Non-Custodial Multi-Chain Wallet A significant challenge in the cryptocurrency realm is managing assets across multiple blockchains. Traditional wallets often support limited networks, compelling users to maintain several wallets for different cryptocurrencies. This fragmentation not only complicates asset management but also exposes users to security risks associated with multiple platforms. Qubetics addresses this issue with its Non-Custodial Multi-Chain Wallet. This wallet empowers users to manage assets across various blockchains without relinquishing control to third parties. For instance, a business operating in Argentina can effortlessly transfer funds from Ethereum to Solana, optimizing transaction fees and speeds. Professionals in Brazil can securely manage their diverse crypto portfolios, ensuring they have full autonomy over their assets. Qubetics's presale is in its 24th stage, with tokens priced at \$0.0976 each. The crypto presale has raised over \$14.7 million, with more than 22,500 token holders and over 497 million \$TICS tokens sold. Projections suggest that \$TICS could reach \$0.25 by the end of the presale, offering a potential return on investment (ROI) of 156%. Post-mainnet launch, forecasts indicate that \$TICS could reach \$10, translating to an impressive 10,137% ROI. Bitcoin: The Pioneer of Cryptocurrency Bitcoin's creation in 2009 by Satoshi Nakamoto marked the beginning of decentralized digital currency. Unlike traditional investments, Bitcoin did not have a formal Initial Coin Offering (ICO). Instead, the first bitcoins were mined through a process that rewarded early adopters with 50 BTC per block. Since there was no market for Bitcoin initially, its first real-world transaction occurred in May 2010, when 10,000 BTC. As Bitcoin's utility and scarcity became more apparent, it began gaining recognition as a store of value, evolving from a niche technology experiment into a globally traded asset with a total market capitalization exceeding \$1 trillion at its peak. The limited supply of 21 million BTC contributed to its price appreciation. Early adopters who mined or purchased Bitcoin for just a few cents per coin eventually saw their holdings grow to staggering values. By 2021, Bitcoin had reached an all-time high of \$69,000, making it one of the best-performing assets in financial history. Conclusion Regretting a missed opportunity is a common sentiment in cryptocurrency investing, and Bitcoin's historical growth serves as a reminder of how early-stage investments in disruptive technologies can lead to significant returns. Qubetics stands out by addressing the multi-chain asset management problem, offering a Non-Custodial Multi-Chain Wallet that allows users to seamlessly manage and transfer assets across different blockchains without relying on third parties. This technological advancement positions Qubetics as a strong contender among the best cryptos to buy this month. With an active crypto presale, robust development roadmap, and a growing participant base, Qubetics presents an opportunity that mirrors the early days of Bitcoin. For More Information: - Qubetics: <https://qubetics.com> - Telegram: <https://t.me/qubetics> - Twitter: <https://x.com/qubetics> Disclaimer: TheNewsCrypto does not endorse any content on this page. Bitcoin's \$17 billion loss has shaken the cryptocurrency market, drawing a reaction from the White House. Regulatory concerns and economic uncertainty have contributed to Bitcoin's decline, leading

investors to search for safer and extra promising alternatives. While traditional crypto holders face mounting stress, Ozak AI traders are witnessing potential profits pushed by its AI-powered approach and increasing adoption. Bitcoin's Massive Loss and Government Concerns Bitcoin's current drop wiped out billions in market price, raising concerns about its long-term stability. Several factors contributed to this decline, consisting of: Regulatory Scrutiny: Governments worldwide, including U.S. Policymakers, are increasing efforts to modify the crypto industry. Stricter policies could affect Bitcoin's dominance. Market Volatility: Bitcoin stays surprisingly volatile, making it a risky funding for those seeking out stability. Sudden price swings often result in huge liquidations, as visible in this latest drop. Macroeconomic Factors: Rising inflation, interest rate modifications, and worldwide financial instability have made buyers careful approximately keeping huge crypto positions. In reaction to the sharp losses, the White House recounted the dangers associated with unregulated crypto belongings. While officials stopped short of calling for an outright ban, discussions round stronger oversight and patron protection measures are gaining traction. Why Ozak AI Investors Are Profiting While Bitcoin holders are experiencing losses, Ozak AI investors are witnessing a boom. Unlike Bitcoin, which is predicated on hypothesis and store-of-value standards, Ozak AI offers real-world software via artificial intelligence and decentralized analytics. Its cutting-edge innovation offers: AI-Powered Market Predictions: Ozak AI makes use of machine learning to offer real-time financial insights, supporting investors and buyers to make data-driven decisions. Decentralized Security: Unlike traditional cryptocurrencies, Ozak AI integrates Decentralized Physical Infrastructure Networks (DePIN) to enhance security and reliability. Scalability and Efficiency: Ozak Stream Network (OSN) ensures seamless data processing, making the platform faster and greater efficient in comparison to standard blockchains. As Bitcoin struggles, demand for AI-driven crypto answers is at the rise. This shift in investor interest positions Ozak AI as a major player in the evolving blockchain space. Moreover, the 3rd stage of the Ozak AI presale is currently going on, and the project is already making waves in the crypto community. With an impressive over \$900K raised so far, Ozak AI tokens are currently priced at just \$0.003 each, with the next stage price set at \$0.005. This early-stage opportunity is poised for significant growth, with projections suggesting that the token could reach \$1 by 2025. A Shift Toward AI-Driven Crypto? The current Bitcoin crash highlights the want for greater advanced blockchain solutions. While Bitcoin remains the flagship cryptocurrency, its loss of innovation has left room for more recent tasks to upward push. Ozak AI represents a brand new era of crypto investments, wherein artificial intelligence plays a key position in riding price. With AI becoming a dominant pressure in various industries, blockchain integration could be the following big trend. If Ozak AI keeps to deliver on its guarantees, it may entice institutional and retail traders seeking out better returns with lower risks. Bitcoin's \$17 billion loss has once more uncovered the volatility and uncertainty of traditional cryptocurrencies. While the White House reacts with regulatory discussions, buyers are turning their attention to AI-powered initiatives like Ozak AI. By imparting innovative technology, predictive analytics, and decentralized protection, Ozak AI sticks out as a promising opportunity. As the market shifts in the direction of shrewd blockchain solutions, early adopters of Ozak AI may be located for big long-term profits. About Ozak AI Ozak AI is a blockchain-based crypto project that provides a technology platform which specializes in predictive AI and advanced data analytics for financial markets. Through machine learning algorithms and decentralized network technologies, Ozak AI enables real-time, accurate, and actionable insights to help crypto enthusiasts and businesses make the correct decisions. The cryptocurrency market has become both a wellspring of opportunity and a labyrinth of challenges for investors. With over 20,000 active digital currencies and daily market volatility, separating the next big opportunity from fleeting hype is no small feat. While Bitcoin and Ethereum continue to dominate as colossal forces in the industry, they face growing criticism for high transaction costs, scalability issues, and limitations in their adaptability. Among this backdrop, a brand-new token is stepping into the spotlight—BinoFi (BINO). Priced at just \$0.02 during its current presale phase, BinoFi is generating discussions as a future-first cryptocurrency with Ethereum and Bitcoin-like potential, but without the barriers that have made these giants increasingly inaccessible to new investors. The Current Crypto Landscape Despite occasional market pullbacks, cryptocurrency remains a thriving force, capturing the imagination of both retail investors and institutions. Bitcoin has long been crypto's crown jewel, paving the way as a store of value and digital alternative to gold. Ethereum, meanwhile, revolutionized the space with its pioneering smart contracts and decentralized applications (dApps). Yet both assets, for all their contributions, highlight a critical challenge in the market, barriers to usability and growth caused by their very success. Bitcoin's widespread popularity elongates transaction times, while Ethereum's network regularly faces congestion, driving gas fees to exorbitant heights. These issues make navigating the crypto world difficult, particularly for first-time investors or those working with limited capital. Investors have started looking for assets with room for explosive growth and solutions that push blockchain technology forward. Emerging tokens like BinoFi (BINO) are capturing attention by addressing head-on the shortcomings of the leaders, with a focus on user accessibility, speed, and important technical innovation. What Sets BinoFi Apart? At the core of BinoFi's appeal is its groundbreaking hybrid crypto exchange. Described as the first of its kind, this exchange combines the speed and liquidity of centralized exchanges (CEXs) with the transparency and decentralization of decentralized exchanges (DEXs). By merging the strengths of these models, BinoFi's ecosystem is solving key pain points for traders and investors alike. These features position BinoFi as a leader in trust, engagement, and privacy within the crypto market. Unique Features Driving Its Success BinoFi stands out in the crypto space with its innovative

features designed to enhance transparency, engagement, and compliance. It offers Live Proof-of-Reserves, allowing users to verify that all funds are fully backed in real-time, and Immutable Audit Trails for tracking trade execution and system integrity. Its Trade-to-Earn model rewards users for trading activity, while Copy Trading lets beginners replicate the strategies of top investors, enabling both new and experienced traders to benefit. Additionally, BinoFi ensures privacy with Zero-Knowledge (ZK) KYC, allowing users to verify their identity without exposing personal data, and adapts compliance requirements based on user location for smooth global operations. Expert Opinions and Early Success Industry analysts are starting to take note. “BinoFi is part of the next generation of crypto, offering a more user-centric and scalable approach than many of its predecessors,” says one blockchain industry analyst. The strong demand analysts observe is evidenced by BinoFi’s presale event. More than 3 million tokens sold out within hours, underscoring its ability to capture investor interest. Market insiders suggest that early adopters see not just novelty in BinoFi, but fundamentals capable of driving long-term value. Testimonials from some of the earliest community members echo these sentiments. “I’ve invested in a fair share of tokens over the years,” says an individual token holder, “but BinoFi feels different. Its hybrid exchange is a game-changer, addressing so many pain points we’ve just learned to tolerate in crypto.” The Verdict The momentum keeps building, thanks to key developments like BinoFi’s recent listing on CoinMarketCap, which has expanded its visibility and enhanced its market credibility. For investors, this offers a rare chance to get involved early in a project with monumental potential. With predictions suggesting BinoFi’s price could skyrocket to \$1.00 in the coming years, the 50x ROI opportunity is hard to ignore. - Website: <https://binofi.com> - Whitepaper: <https://whitepaper.binofi.com> - Telegram: <https://t.me/binofilabs> - Twitter: <https://x.com/Binoficom> - CoinMarketCap: <https://coinmarketcap.com/currencies/binofi/> Disclaimer: TheNewsCrypto does not endorse any content on this page. Investors who recognized early opportunities in crypto’s biggest winners saw life-changing gains. Now, the same pattern is unfolding, but this time, it’s happening in a booming, \$450 billion industry that never sleeps. Will you be the one who got in early, or the one who regrets missing out? The latest executive order establishing the U.S. Strategic Bitcoin Reserve is a clear sign “Bitcoin is becoming an institutional asset, no longer the people’s crypto. Traders are already reacting, with BTC surging past \$92K before crashing back to \$87K, leaving many wondering if Bitcoin’s best days are behind it. Meanwhile, BitLemons (\$BLEM) isn’t waiting for the market to decide its fate. With a fully operational revenue model, real gaming profits, and a price that’s already doubling in presale, it’s proving that the real money isn’t in waiting—it’s in winning. BTC’s Grip is Slipping, \$BLEM is Taking the Lead Bitcoin remains the most recognized digital asset, but recognition doesn’t always translate to strong, consistent returns. While BTC battles institutional control and unpredictable market cycles, BitLemons is delivering direct, revenue-backed value to investors. The difference is clear. While Bitcoin relies on market sentiment and institutional buy-in, BitLemons is generating actual revenue through its gaming platform. The crypto casino industry operates around the clock, generating profits 24/7, giving investors a business-backed token rather than one driven by speculation. Why \$BLEM Is Winning Where Bitcoin Stalls Bitcoin’s early appeal was rooted in financial freedom, but the landscape has changed. Governments are now holding Bitcoin in reserves, and state-led initiatives in Texas and Utah are reinforcing institutional dominance over the asset. As a result, Bitcoin’s market behavior is increasingly dictated by institutional traders rather than retail investors. This shift has created uncertainty, leading many to explore opportunities that provide more than just potential future appreciation. BitLemons is already proving itself in a high-growth sector. The platform is fully operational, with thousands of casino games from top-tier providers like Evolution and Pragmatic. Investors aren’t waiting on regulatory decisions or institutional moves—they’re earning through GambleFi rewards tied directly to gaming revenue. BTC’s Instability is \$BLEM’s Opportunity Bitcoin’s price action is a rollercoaster of uncertainty. After hitting \$92K, it tumbled back to \$87K, and traders are eyeing the \$85K support level to see if it holds. With the White House set to discuss crypto regulation, the market is in wait-and-see mode. Meanwhile, BitLemons investors aren’t waiting—they’re stacking early gains. Stage 1 of the presale sold out in just 16 days, and Stage 2 is already 76% gone. With the next price increase from \$0.02 to \$0.03 just a few days away, those getting in now are securing their spot before the market catches up. Investors in the first round have already doubled their money, and with a rumored listing price of \$0.17-\$0.18, the upside is clear. While Bitcoin investors debate government involvement, BitLemons investors are cashing in. Numbers Don’t Lie, Strategies Do Bitcoin is a market-driven asset, but BitLemons is a revenue-driven one. That’s the difference. With 30% of Gross Gaming Revenue (GGR) fueling the token economy, holders benefit from a model designed for long-term sustainability, not speculation. Fifteen percent of revenue is allocated to buybacks, ensuring that price appreciation is backed by real money—not just hype. Another 15% is distributed as staking rewards, creating a passive income stream that Bitcoin simply can’t offer. Bitcoin’s future depends on external factors like regulation, institutions, and macro trends. BitLemons’ future is tied to direct gaming revenue that never stops. Grab \$BLEM Before the Next Stage Hits The current price of \$BLEM is locked at \$0.02, but time is running out. In just a few days, the price jumps to \$0.03, and demand is increasing fast. Stage 1 sold out in just 16 days, and Stage 2 is already 76% filled. The opportunity to secure an early position is closing quickly, and with momentum building toward the public launch, waiting could cost you. Bitcoin has had its moment. Now it’s trading sideways, battling volatility, and facing institutional control. Meanwhile, BitLemons is surging ahead with real adoption, real revenue, and real profits. You’ve seen this happen before—some will wait and watch, others will act and win. Join the Revenue Revolution with BitLemons (\$BLEM) Today! - XRP, Solana, and Cardano dropped due to Bitcoin reserve, thus Trump clarified only Bitcoin would receive active support. - Meme coins like Dogecoin and Shiba Inu fell due to unconfirmed reserve inclusion. - The crypto market dropped 4%, with uncertainty lingering ahead of the White House Crypto Summit. The crypto market has witnessed high volatility today, with top altcoins such as Ethereum (ETH), Solana (SOL), and XRP experiencing price drops. President Donald Trump's recent executive order to create a Bitcoin strategic reserve first fueled hopes of a wider U.S. push into crypto. But these altcoins are falling as the market responds to conflicting signals. XRP, Solana, and Cardano Dropped despite Bitcoin reserve XRP, Solana, and Cardano enjoyed a brief burst of optimism after being included in Trump's reserve plan. But the optimism did not last long after Trump made it clear. The government would actively support only Bitcoin, while other coins such as XRP, Solana, and Cardano. Would only be included in the reserve if governments confiscated them. XRP dipped 2%, Solana lost 5%, and Cardano dipped 10%. This change suppressed investor sentiment and precipitated a sell-off, eliminating recent gains. The anticipation that the U.S. government would diversify its crypto reserves was dispelled, further fueling the downtrend in the market. Meme Coins declined Meme coins such as Dogecoin (DOGE), Shiba Inu (SHIB), and Pepe Coin (PEPE) reflected the general market decline after bitcoin reserve announcement. DOGE declined 5%, SHIB fell by 2%, and PEPE lost 6%. Earlier this week, rumors had circulated that DOGE could be added to the reserve, triggering a brief price increase. But with no official support from Trump's proposal, the gains were short-lived. The overall crypto market experienced a drop of almost 4%, with the world's market capitalization reducing to \$2.88 trillion. The reserve's under-diversification has instilled doubts in investors. Although the prices did fall, tokens such as MOVE, Sui, and Jito recorded some positive gains, yet the market is still bearish. White House Crypto Summit All eyes now shift to the White House Crypto Summit for possible policy updates that would give insight into the future of U.S. crypto rules. Investors are optimistic about a more open-minded approach, but hopes are low. The market, meanwhile, will probably continue to suffer from uncertainty as traders readjust their strategies because of the volatile market atmosphere. Trump's Bitcoin reserve announcement was a step forward for the crypto space, the market remains volatile, and investor confidence in altcoins is wavering. Highlighted Crypto News Today 4 Bullish Reasons Why Trump's Bitcoin Reserve Is a Game Changer

- The U.S. holding Bitcoin reserve reduces regulatory risks, making a ban highly unlikely and boosting investor confidence. - Institutional and global adoption may accelerate as governments and financial entities recognize Bitcoin's legitimacy. - Bitcoin's status as "digital gold" strengthens, solidifying its role in the future of global finance. The world of cryptocurrency has just taken a drastic turn with former U.S. President Donald Trump's executive order to create a Strategic Bitcoin Reserve (SBR). The development has triggered a combination of optimism and skepticism in the crypto community. Although Bitcoin initially experienced a 6% price decline, most experts feel that this move will have positive long-term implications. A Step Towards Bitcoin Adoption The U.S. government's move to create a Bitcoin reserve is unprecedented. As opposed to other asset reserves like gold, this strategic reserve is made up entirely of Bitcoin obtained from criminal operations. With a projected 200,000 BTC already on its books, the U.S. is now one of the world's biggest Bitcoin owners. Crypto experts contend that this move lowers regulatory risk, legitimizes Bitcoin, and indicates a new direction for how governments think about digital assets. While some investors are concerned, the bigger picture might actually influence the future of Bitcoin and international financial systems. Why Trump's Bitcoin Reserve Is a Bullish Signal A Lower Risk of a Bitcoin Ban: Regulatory uncertainty has long been a concern for Bitcoin investors. However, with the U.S. now holding Bitcoin in its strategic reserves, a blanket ban is highly unlikely, providing greater security for investors and institutions. Accelerating Global Bitcoin Adoption: As a financial powerhouse, the U.S. embracing Bitcoin could inspire other nations to follow suit. Countries that were hesitant may now build their own reserves, fueling global adoption and solidifying Bitcoin's role in international finance. Strengthening Institutional Legitimacy: With U.S. government recognition, mainstream financial institutions can no longer dismiss Bitcoin. This shift could drive adoption among pension funds, wealth managers, and major financial players. No Cost to Taxpayers: Unlike traditional reserve assets, the U.S. Bitcoin holdings come from seized funds, not taxpayer money. This ensures a strategic advantage without causing inflation or economic instability. Bitcoin's Future in Finance: With government backing, growing adoption, and institutional acceptance, Bitcoin is securing its place as a key player in the future of global finance. Trump's plan for Bitcoin has generated controversy regarding the positioning of digital assets within the global economy. Some think that as governments hold more Bitcoin, its scarcity will push prices up and will be beneficial for long-term holders. Others think that government access to Bitcoin reserves can create regulatory headaches for the future. Bitcoin is no longer an outsider asset: Despite various opinions, there is one fact: Bitcoin is no longer an outsider asset. With the U.S. government officially possessing BTC, its reputation as a store of value has been strengthened. If other countries continue this trend, Bitcoin's reputation as "digital gold" will become even stronger. Trump's Bitcoin reserve constitutes a significant change in the way governments view cryptocurrency. Although the short-term market response was ambiguous, the long-term consequences might be transformational for Bitcoin and the wider crypto environment. With America now at the forefront as a major Bitcoin owner, institutional acceptance will probably increase at an accelerated pace, and there may be increased global adoption. Whether this action will usher in a new financial age or bring unexpected problems is yet to be determined but this is one thing: Bitcoin is here to stay.

The crypto world is buzzing with excitement as meme coins continue to capture the imagination of investors and enthusiasts alike. Recent developments have only added fuel to the fire. The U.S. Securities and Exchange Commission (SEC) recently declared that meme coins are akin to collectibles rather than securities, providing clarity and potentially paving the way for more mainstream acceptance. At the same time, the market has witnessed a surge in meme coin activity, with new entrants making significant waves. Among these emerging stars is Arctic Pablo Coin, a meme coin that stands out for its financial prospects and adventurous narrative. Arctic Pablo Coin invites investors on a mystical journey across uncharted territories, blending the allure of hidden mysteries with the potential for substantial returns. Each phase of its presale is tied to unique locations and stories, creating a rich tapestry that bridges the gap between myth and reality. Arctic Pablo Coin: Embark on a Mystical Journey with High ROI Potential Arctic Pablo Coin (\$APC) isn't just another meme coin; it's an invitation to join an epic adventure led by the intrepid explorer, Arctic Pablo. This coin weaves a narrative that takes investors through uncharted icy realms, each presale phase representing a new location filled with hidden treasures and stories. Unlike traditional presales divided into stages, Arctic Pablo Coin's presale is segmented by locations, each symbolizing a new chapter in Pablo's journey. As of now, Arctic Pablo has reached Chillville, the 13th phase of its expedition. The current price per APC token is \$0.000070, with over \$1.77 million raised so far. The launch price is set at \$0.008, offering early investors a staggering ROI potential of over 11,285.71% from this stage to the listing price. Investors can participate in a staking program offering a 66% Annual Percentage Yield (APY). Holders can enjoy generous rewards by staking APC tokens while contributing to the network's security and stability. All staked coins will be vested for two months from the launch date, encouraging long-term commitment. It is one of the best new meme coins to buy this week. Turn \$500 into \$714,063? Arctic Pablo's Insane Growth Potential! Crypto analysts predict Arctic Pablo Coin could surge to \$0.1 post-listing, and the numbers are staggering. At today's presale price of \$0.00007, a \$500 investment secures 7,140,635 APC tokens. Once APC lists at \$0.008, that turns into \$57,125—but if it reaches \$0.1? That same \$500 could skyrocket to an unbelievable \$714,063! With each presale phase selling out fast, prices are rising. History shows meme coin presales can create millionaires overnight—is Arctic Pablo your ticket to life-changing gains? Dog (Bitcoin): The Fusion of Meme Culture and Bitcoin's Robustness Dog (Bitcoin), often called DOG, represents a fascinating fusion of meme culture with the robustness of Bitcoin's blockchain. As a Bitcoin-based meme coin, DOG has carved out a unique niche in the crypto space. DOG has experienced remarkable growth, climbing to become the ninth-largest meme coin by market capitalization. Over 30 days, DOG saw a 216% rise, reflecting increasing investor interest and market confidence. Built on Bitcoin's blockchain using the Runes protocol, DOG benefits from Bitcoin's security and widespread recognition. This integration allows DOG to leverage Bitcoin's infrastructure while offering the playful appeal characteristic of meme coins. The DOG community has been instrumental in its growth, driving adoption through social media engagement and grassroots marketing. Speculation about potential listings on major exchanges, such as Binance, has further fueled interest, contributing to price surges and heightened visibility. Sudeng: The Underdog with Massive Potential Sudeng is one of the latest entrants into the meme coin space, and despite its relative obscurity, it has been making waves with its quirky branding and solid tokenomics. Combining humor, community engagement, and a strategic growth plan, Sudeng quickly emerges as a coin to watch. Sudeng's charm lies in its relatability and viral potential. Unlike other meme coins, Sudeng takes a more grassroots approach, using organic community-driven marketing efforts to propel itself into the spotlight. Sudeng has a limited supply that follows a strategic burn mechanism, ensuring scarcity over time. With an allocation designed to support liquidity, community rewards, and staking, Sudeng's structure favors long-term sustainability and investor engagement. Sudeng isn't just another meme coin; it's a movement. The team behind Sudeng has been actively engaging with the community through interactive campaigns, meme competitions, and influencer partnerships. As a result, Sudeng has gained significant traction on social media platforms, drawing in thousands of investors looking for the next big meme coin to explode. Conclusion Based on our research and market trends, Arctic Pablo Coin, Dog (Bitcoin), and Sudeng stand out as the best new meme coins to buy this week. Arctic Pablo Coin's innovative presale and staking rewards, Dog (Bitcoin)'s integration with the Bitcoin blockchain, and Sudeng's grassroots movement all make them excellent candidates for explosive growth. The current stage of Arctic Pablo Coin's journey presents a unique opportunity to invest at an incredibly low price before the presale moves to the next location. Don't miss out on the adventure—join the Arctic Pablo meme coin presale now! For More Information: - Arctic Pablo Coin: <https://www.arcticpablo.com/> - Telegram: <https://t.me/ArcticPabloOfficial> - Twitter: <https://x.com/arcticpabloHQ> FAQs: What makes Arctic Pablo Coin one of the best new meme coins to buy this week? Arctic Pablo Coin (\$APC) is not just another meme coin—it's an immersive adventure with each presale phase unlocking new locations and stories. With a current price of \$0.000070 and a launch price of \$0.008, early investors have a rare chance at massive ROI. The 66% APY staking rewards and weekly token burns add to its long-term sustainability and scarcity. How does Dog (Bitcoin) differ from other meme coins? Unlike typical meme coins, Dog (Bitcoin) (DOG) is built on Bitcoin's blockchain using the Runes protocol, ensuring security and stability. This unique approach merges Bitcoin's robust technology with the viral appeal of meme coins, making it a strong contender in the growing meme coin sector. Is Sudeng a good investment opportunity? Sudeng is a rapidly emerging meme coin with strong community backing and a deflationary token model. Its limited supply and strategic token burns create scarcity, while its organic grassroots marketing strategy has propelled it into the spotlight. As a result, Sudeng has strong potential for future gains. Disclaimer: TheNewsCrypto does not endorse any content on this page. - The White House announced a Strategic Bitcoin Reserve via an executive order. - A new U.S. Digital Asset Stockpile will manage other cryptocurrencies. The White House has confirmed the creation of a Strategic Bitcoin Reserve, a move outlined in an executive order signed by President Donald Trump. This initiative comes just one day before the administration's first-ever crypto summit. The order directs the Treasury Department to establish an office managing the reserve, which will hold Bitcoin (BTC) confiscated through criminal or civil asset forfeiture. The U.S. government currently possesses around 198,109 BTC, valued at approximately \$16.92 billion. However, past Bitcoin sales resulted in an estimated \$16.14 billion loss due to premature liquidations. Trump's Strategic Bitcoin Reserve Trump's executive order also establishes a U.S. Digital Asset Stockpile to manage other cryptocurrencies. While Bitcoin will be held indefinitely, different assets may be used for law enforcement operations or returned to crime victims. The Treasury Department must submit a full accounting of all government-held digital assets within 30 days. Trump's support for crypto contrasts sharply with former President Joe Biden's regulatory crackdowns. His administration actively engages with the crypto industry, appointing David Sacks as the White House czar for AI and cryptocurrency. Sacks stated that the government's Bitcoin holdings exceed 200,000 BTC, currently worth around \$17.5 billion. On Sunday, Trump revealed plans to expand digital asset reserves, including Ethereum, Solana, XRP, and Cardano. His announcement sparked mixed reactions within the industry, with some questioning the move's long-term impact. Critics argue that a government-held Bitcoin reserve could destabilize the market. Law professor Hilary Allen previously warned that selling large amounts of BTC could cause price crashes, undermining the asset's value. The White House's crypto summit will gather industry leaders to discuss regulations and policy directions. Highlighted Crypto News Today Bitcoin Slides to \$87K Despite Crypto Summit and Strategic Reserve Execution

- Bitcoin has factored a modest price dip of 4.89% in the last 24 hours. - The cryptocurrency's daily trading volume has surged by 14.99% as per CMC data. The digital assets community is eagerly anticipating the White House Crypto Summit. The overall market cap has shown a modest increase, as depicted by its 4.18% upward momentum. However, the largest cryptocurrency, Bitcoin, has shown modest price drops yet again this week. Notably, US President Donald Trump signed an executive order approving a national Bitcoin Strategic Reserve in the past day. This marks a crucial milestone in crypto history and US history. On the other hand, the digital asset's downward movement despite this advancement has raised speculations. On its daily price chart, Bitcoin shows a 4.89% drop over the last 24 hours. In the morning hours of March 6, the cryptocurrency was trading at a high of \$92,804. However, as bearish signs took over, BTC slid to the \$87,000 range. At the time of writing, the digital asset was trading at \$88,148 as per CMC data. Zooming out, to its weekly trading history, Bitcoin shows bullish trends. Despite fluctuations, it has managed to depict a 10% surge from the Monday market crash. Traversing from a 5-month low of \$78,258 it also tested a high of \$95,043 during the span of the last 5 days. Will Bitcoin Fall Further Before A Rebound? On analyzing its recent price actions, Bitcoin traces a horizontal pattern. This suggests that the token is entering a consolidation phase. The consolidation range stands between \$83K - \$95K. The horizontal channel indicates that it could either be followed by a price descent or a breakout. Secondly, its Moving Average Convergence Divergence (MACD) signal line recently crossed over the MACD line entering a negative environment. This shows that Bitcoin still holds the potential to turn bullish. Additionally, its RSI value stands at 43.33 suggesting an oversold market situation as per TradingView data. Meanwhile, other altcoins such as XRP and Tron have shown modest price decreases in the last 24 hours.

- The White House Crypto Summit could trigger a "sell-the-news" event. - Bitcoin price support levels are at \$87,200 and \$82,908, with potential declines to \$70,000. - The \$92,000 short-term holder cost basis is key for determining momentum. Bitcoin's recent breakout of the \$90,000 support level has increased fears of a potential liquidity grab under this crucial price zone. On March 6, Bitcoin (BTC) hit a high of \$92,700, which represented a 19% rise from the February 28 low of \$78,200. The price rise fuelled optimism in the market. Bitcoin's subsequent rejection at \$94,500, however, has opened the door to the possibility of a further decline in the coming days. The White House Crypto Summit's Impact Everyone waits with bated breath for the March 7 White House Crypto Summit. Ahead of a pro-crypto position from the U.S. government, there lies a possibility of bullish sentiment pushing prices upwards. Yet, there also remains a risk of a "sell-the-news" situation if the summit's results fall short of market expectations. The summit, to be hosted by U.S. President Donald Trump, seeks to unite industry leaders to address important matters like regulatory policies, stablecoin regulation, and the place of cryptocurrencies in the U.S. financial system. Some of the prominent guests will be names such as Michael Saylor, Strategy founder, Brad Garlinghouse, Ripple CEO, and Brian Armstrong, Coinbase CEO. Although the Trump administration has been friendly to the crypto space, the results of the summit are far from certain. Any overbearing regulatory actions, like strict KYC regulations or taxing unrealized gains, might have the potential to spook investors. Past crashes, such as the 2022 crash after Biden's SEC crackdowns, demonstrate Bitcoin's vulnerability to policy changes. If the summit doesn't provide the expected regulatory clarity or adds unforeseen compliance requirements, Bitcoin's price could drop sharply by 20-30%, as seen in previous patterns. Such was the case after Trump's release of a Strategic Crypto Reserve, where Bitcoin first jumped but eventually fell 15% from \$95,150 to \$81,483. Important Bitcoin Price Levels On March 6, Bitcoin briefly touched \$92,000 before pulling back. Traders are now focusing on crucial support levels, especially in the range below \$90,000, as Bitcoin may revisit these levels soon. The key initial support area is at \$87,200, then comes the 200-day simple moving average (SMA) level at \$82,908. Below these prices, Bitcoin might aim for the cluster of liquidity in the zone of \$81,463-\$78,200, which had developed in early March and February, respectively. In case of a breakdown past the \$90,000 level of support, these levels can prove to be the crucial areas, and an extension of losses may have Bitcoin challenging the band between \$74,500-\$75,800, with further extension towards the \$70,000 level.

Conversely, Bitcoin is resisting at \$92,000 and \$97,400, where the 50-day and 100-day SMAs meet. Breaking through this resistance area would mark the termination of the current downtrend and potentially drive Bitcoin to new highs, with \$100,000 and above in the sights. The STH cost basis of \$92,000 is still a level to watch. Glassnode analysts have pointed out that this level has been important in the past during bull market uptrends. If the market continues to fall, the \$71,000 area is an important area to watch. The active realized price at \$70,000 also coincides with the lower band of the STH cost basis, making the \$70,000 level an important support area. Though Bitcoin demonstrated strength and hope after recent price fluctuations, these major factors like the White House Crypto Summit and future regulatory changes may actually decide the short-term path of the market. Highlighted Crypto News Today Michael Saylor Advocates for a U.S. Bitcoin Reserve at White House Crypto Summit

- Michael Saylor sees the Crypto Summit as key to making Bitcoin the U.S. reserve asset. - Industry leaders at the Crypto Summit will discuss regulations and crypto adoption. - The Crypto Summit aims to shape a clear framework for a U.S. Bitcoin reserve. Michael Saylor, MicroStrategy executive chairman, once again underlined the role of Bitcoin as the basis of a U.S. strategic crypto reserve. Ahead of the soon to be held White House Crypto Summit. Saylor reiterated that Bitcoin is the sole digital asset upon which all can agree, without an issuer. And hence best suited for national reserves. It will be hosted by President Donald Trump and chaired by White House crypto czar David Sacks. And will gather leading industry players such as Coinbase CEO Brian Armstrong, Crypto.com CEO Kris Marszalek, and Kraken CEO Arjun Sethi. The topics will cover the framework, funding, and regulation for the envisioned U.S. crypto reserve. Why the U.S. Needs a Bitcoin Reserve? Saylor emphasized the necessity of a strategic and open method of accumulating Bitcoin. This cites the Alumnus Bill, which suggests the purchase of one million BTC within four years. He is of the opinion that by locking up Bitcoin early, the U.S. can dominate the digital economy before other countries. Although Trump initially proposed to include altcoins such as XRP, Solana, and Cardano in the reserve. Thus, industry opposition resulted in a clarification that Bitcoin and Ethereum would be its main assets. Saylor, however, insists that Bitcoin must be the focus, as it is a digital commodity with no central issuer. Critics have raised the question of whether a Bitcoin reserve is needed, likening it to conventional strategic reserves such as oil or weapons. Saylor responded by framing Bitcoin as the “property of cyberspace” and a vital asset in ensuring U.S. financial leadership. With the changing regulatory environment, Saylor encouraged the administration to have well-defined digital asset rules in place before large-scale buying. He emphasized that whatever acquisition is done, it has to be done “deliberately, progressively, and transparently.” Highlighted Crypto News Today Bitcoin Cash (BCH) Surges Over 30% This Week, Will it Sustain?

Key Highlights: - House Bill 302 moves to a full House vote after a 16-1 approval. - Bitcoin allocation was reduced from 10% to 5% for secure management. - New Hampshire could join Texas, North Carolina, and Oklahoma in Bitcoin reserves. New Hampshire is progressing towards adopting Bitcoin to its state reserves portfolio through a legislative bill proposed by Representative Keith Ammon. The House Commerce and Affairs Committee strongly backed House Bill 302, enabling state treasury investment in Bitcoin and precious metals before the bill gained a 16-1 vote of approval. Following approval by committees, the bill will advance for consideration by the full House membership. This milestone demonstrates New Hampshire’s accelerating move towards adopting crypto methods. The approval of this bill would make New Hampshire part of the states that use Bitcoin as a reserve asset along with Texas, North Carolina, and Oklahoma. Government institutions across the nation continue to adopt cryptocurrency as an essential part of their financial systems through localized strategies. New Hampshire Bitcoin Bill Limits Allocation to 5% for Security The initial proposal of House Bill 302 sought the utilization of 10% from New Hampshire’s general fund to purchase Bitcoin before the lawmakers revised the amount to 5%. A more careful approach to digital asset management led to the reduction of the proposed Bitcoin investment from 10% to 5% under New Hampshire House Bill 302. The state is mandated through this bill to work with licensed custodial experts who ensure secure asset protection against security threats. The new legislation bases its approach on global concerns about digital asset storage alongside regulatory oversight as governments examine cryptocurrency as a financial reserve. Growing Interest in Bitcoin as a Reserve Asset The state of New Hampshire stands among numerous governments worldwide which adopted Bitcoin solutions in this current period. Brazil together with Poland, alongside various other countries started exploring to put cryptocurrency in national reserves. The Bitcoin acquisition strategy brought forth by El Salvador serves as an exemplary approach for public institutions to invest in digital assets. A New Hampshire House decision in the near future will decide whether the state will add Bitcoin to its treasury assets officially. The successful passing of this legislation would place New Hampshire at the forefront of U.S. states that maintain Bitcoin in their fiscal reserves. Highlighted Crypto News Today:

- Bitcoin Cash (BCH) price increased by 33% this week. - With a 12% daily price surge, BCH is set to reach the 3-digit mark soon. Bitcoin Cash is witnessing a significant price surge for the past few days. Since its bull run at the end of 2024, BCH has been trending downwards. However, its price started to recover a couple of days ago and is recording two-digit price rises. Meanwhile, market analysts are forecasting whether BCH can sustain in the coming weeks. Bitcoin Cash (BCH) Price (Source: CoinMarketCap) BCH is trading at \$398.38 at press time with a 11.56% daily surge and 32.58% weekly surge. The rise in its trading volume of 88.45% reflects increased investor interest in BCH. Its market cap has also increased by more than 10% and it is currently standing at \$7.9 billion. The BCH price rise is gaining traction across the market as it is outshining the market performance of several top altcoins, including Bitcoin. While BTC price has only increased by 2.40%, Ether witnessed 1.93% surge, and XRP rose by 3.41%. Even Solana and Dogecoin prices increased by only 2.74% and 3.24% respectively. Will Bitcoin Cash (BCH) Sustain its Price Rally? Bitcoin Cash (BCH) price found support

levels at \$279.2 and \$299.7 last week. At the time of writing, it is trading at \$394.75 and briefly touched the \$418 mark earlier today. If the rally continues, it could surge past the \$400 mark and reach further higher price levels. Since Bitcoin is facing extreme volatility in the present times, investors might start considering its alternative investments. Bitcoin Cash (BCH) and Bitcoin SV are the top two alternative investments to Bitcoin since they emerged from the original Bitcoin source code. Meanwhile, the hype around the White House Crypto Summit could also be one of the reasons behind the BCH price rally. As per TradingView, RSI indicates 66, which shows there is potential for further price rally of Bitcoin Cash. Highlighted Crypto News Today: Is a Run to \$20 in Sight for Chainlink (LINK) After Jumping 7%?

- Trump's crypto reserve is likely to be "nearly entirely Bitcoin," says Bitwise CIO Matt Hougan. - Some industry leaders are not happy with the inclusion of small-cap cryptocurrencies in US reserves. Bitwise's Chief Investment Officer, Matt Hougan, shared his view on Trump's US crypto reserve. Despite initial plans to include various altcoins, Donald Trump's proposed cryptocurrency reserve will likely end up being almost exclusively Bitcoin, according to Bitwise CIO Matt Hougan. Hougan highlights that the market's initial negative reaction to the inclusion of smaller cryptos misses the bigger picture of what could become a significant government investment in digital assets. He predicts that when everything is finalized, Bitcoin will dominate the US reserve. Market Confusion Over Reserve Composition In a March 5 blog post, Hougan stated that including small-cap cryptocurrencies in US reserves unnecessarily complicated matters. On Sunday, March 2, Trump announced that the reserve would include Bitcoin, Ethereum, Solana, XRP, and Cardano. Initially, the market spiked on the news, with Bitcoin jumping from \$85,000 to \$95,000. But on the next day, the market started to pare back and ate almost all their announcement gains. This was partly due to Trump delaying auto parts tariffs on Canada and Mexico. Some industry leaders questioned the inclusion of smaller cryptocurrencies of what they consider speculative assets. Coinbase CEO Brian Armstrong argued that only Bitcoin, as "a successor to gold," should be included in such a reserve. Commerce Secretary Howard Lutnick has suggested that Bitcoin might receive special status in the reserve while "other crypto tokens will be treated differently" positively, but differently. Hougan believes the final composition will evolve following input from industry leaders at the upcoming White House crypto summit. He predicts that "despite the flawed rollout," the reserve will ultimately prove bullish for cryptomarkets, particularly Bitcoin. - Mt Gox moved around 12,000 BTC as the Bitcoin price regained the \$92K mark. - The exchange still holds 36,080 Bitcoins and its deadline for fund returns extended to Oct 31, 2025. Mt Gox moved around 12,000 Bitcoins today to different wallet addresses. Since its bankruptcy filing in 2014, several creditors are awaiting their repayments. As per its announcement in October 2024, the repayment deadline extended to October 31, 2025. Mt. Gox just transferred 166.5 \$BTC(\$15.05M) again, probably to #BitGo.<https://t.co/Szb0IPE5sl><https://t.co/9KF0v9tjay> pic.twitter.com/VQ2UNLIyIr " Lookonchain (@lookonchain) March 6, 2025 As per on-chain data tracker Lookonchain, Mt Gox moved 11,834 Bitcoins worth \$1.07 billion to a new wallet. At around the same time, it transferred another \$166.5 Bitcoins worth \$15.05 million to a cold wallet. The two transactions only cost \$1.64 or 0.00001808 BTC. The Mt Gox exchange became one of the top crypto exchanges in its early years of operation. However, it went bankrupt in 2014 and still needs to pay huge amounts of repayment to its creditors. As per the Arkham Intelligence platform, the defunct exchange still holds 36,080 Bitcoin holdings worth \$3.31 billion. It is unclear if the present BTC transactions are repayments or unusual fund transfers. Mt Gox Moved Funds as BTC Regained \$92K The Bitcoin market price has been facing volatility for the past few weeks. After a steady recovery, it is now trading at \$92,368.27 with an 8.56% surge. The defunct exchange made BTC transfers when its market price just crossed the \$90K mark earlier today. When Bitcoin hit a milestone of \$100K, Mt Gox transferred \$2.43 billion to unknown wallet addresses. Even though the exchange made repayments in fiat currency for some creditors, it needs to repay funds in BTC and BCH for the remaining creditors. Thus, a surge in the BTC price is beneficial for repayments. Highlighted Crypto News Today: Monthly Market Insights Report by Binance Research Highlights Key Trends and Developments

Ever wondered which crypto project will dominate the market next? While Bitcoin continues making headlines as a potential U.S. crypto reserve, XRP is caught in the crossfire of regulatory battles that could determine its future. Meanwhile, Qubetics is shaking up the industry by making blockchain development more accessible through its QubeCode IDE. If you're looking for the best crypto investment, these three deserve your attention. Qubetics (\$TICS) is tackling one of the biggest barriers in blockchain adoption—the complexity of building decentralized applications. Its drag-and-drop IDE is simplifying smart contract creation, making it easier for developers and businesses to integrate blockchain solutions. While XRP and Bitcoin dominate the headlines, Qubetics is quietly gaining momentum, with its presale already raising millions. Could this be the most overlooked crypto opportunity of 2025? QubeCode IDE: The Future of Blockchain Development Imagine trying to build a website from scratch without templates or coding shortcuts—sounds like a nightmare, right? That's exactly how most blockchain development has been. Qubetics is changing that with its QubeCode IDE, a visual development environment designed to make blockchain programming as easy as drag-and-drop. For businesses, this is a game-changer. Companies looking to integrate blockchain for secure payments, supply chain tracking, or decentralized identity management no longer need an army of developers. With pre-built blockchain components for authentication, token management, and data storage, even those with minimal coding experience can build decentralized applications. Even independent developers benefit from the form-based smart contract configuration, allowing them to define application logic without intricate code editing. QubeCode's code snippet library further simplifies the process, offering pre-written solutions for common blockchain tasks. By making blockchain more accessible,

Qubetics is positioning itself as a best crypto investment for those betting on mass adoption. Qubetics Presale: The Window for High ROI Is Closing With crypto enthusiasts constantly hunting for the best crypto investment, Qubetics (\$TICS) has become a hot topic. Currently in its 24th presale stage, it has already raised \$14.6 million, with over 22,200 holders and 495 million \$TICS tokens sold. Right now, the price is \$0.0976, but this will increase by 10% this Sunday at 12 AM when the next stage begins. The potential returns are turning heads. If \$TICS reaches \$0.25 by the end of the presale, early buyers could see a 155.93% ROI. But the real excitement lies in long-term projections—“if \$TICS hits \$10 post-mainnet launch, that translates into a 10,137.16% ROI. To put that into perspective, a \$750 investment today would be worth \$7,680 at \$1 per TICS and a staggering \$115,200 at \$15 per TICS. With the best crypto presale nearing its final stages, those looking for early entry pricing won’t have much time left.

XRP: Regulatory Battles Shake Up Market Sentiment XRP is once again at the center of crypto volatility, with market reactions driven by speculation surrounding the SEC appeal and discussions about crypto reserves. Recent movements indicate that XRP remains highly reactive to regulatory developments, with sentiment shifting rapidly. Currently, XRP traders are watching for signals that could influence price momentum. The SEC appeal has added uncertainty, but if a favorable ruling emerges, XRP could see significant upward movement. Meanwhile, talks about including XRP in potential crypto reserve discussions have further fueled speculation. With regulatory clarity still in limbo, XRP remains a high-risk, high-reward play. Traders looking for the best crypto investment must weigh the potential upside against the legal uncertainties that continue to impact XRP’s trajectory.

Bitcoin: U.S. Crypto Reserve Discussions Spark Debate Bitcoin’s role as a financial powerhouse just took another twist, with Coinbase and Gemini’s CEOs advocating for BTC as the U.S. crypto reserve. The idea? A Bitcoin-only reserve system to strengthen economic resilience, particularly as global financial policies evolve. This discussion has stirred market excitement, especially as Bitcoin continues to trade at elevated levels. If policymakers take this proposal seriously, it could trigger massive institutional adoption, reinforcing Bitcoin’s status as the ultimate best crypto investment. However, the road to a Bitcoin-backed reserve isn’t straightforward. Regulatory hurdles and opposition from traditional financial institutions pose significant challenges. But if Bitcoin maintains its momentum and secures further institutional backing, its long-term dominance seems undeniable.

Conclusion: Which Crypto Stands Out the Most? Qubetics, XRP, and Bitcoin each present compelling opportunities. XRP is navigating high-stakes legal battles that could define its future, Bitcoin is making headlines with discussions about becoming a U.S. crypto reserve, and Qubetics is revolutionizing blockchain accessibility while offering one of the best crypto investment opportunities through its high-demand presale. As the crypto presale window closes, those looking for maximum upside potential may want to join this crypto presale before the next price jump.

For More Information: - Qubetics: <https://qubetics.com/> - Telegram: <https://t.me/qubetics> - Twitter: <https://twitter.com/qubetics>

FAQs Why is Qubetics considered a best crypto investment? Qubetics is solving blockchain complexity with its drag-and-drop IDE, making smart contract development more accessible. Its presale success signals strong demand and future growth. How is Bitcoin’s potential as a U.S. crypto reserve impacting its value? Discussions about Bitcoin becoming a U.S. reserve asset have fueled institutional interest. If adopted, it could solidify Bitcoin’s position as a dominant financial asset. What’s next for XRP amid the SEC appeal? XRP’s price remains tied to regulatory developments. If the SEC appeal is resolved favorably, XRP could experience significant upward movement.

LearnBitcoin.com, the innovative education platform designed to demystify Bitcoin, has officially launched its flagship tutorial series, Be Your Own Bank. Combining personalized learning paths, engaging tutorials, and a practical, no-hype approach, the platform empowers individuals to safely acquire, store, and manage Bitcoin independently. Amid growing cryptocurrency adoption, LearnBitcoin.com addresses a critical need for accessible, trustworthy education. Founder Ian Treibick, a respected Bitcoin educator active in the space since 2013, established the platform after recognizing how complex and intimidating Bitcoin ownership could be for newcomers. “I discovered Bitcoin over a decade ago and quickly realized there was a massive gap in clear, scam-free guidance,” says Treibick. “With LearnBitcoin.com, we’ve created the resource I wish I’d had from the start: personalized, straightforward, and designed to empower everyday users to become their own banks.”

Key Features of LearnBitcoin.com - Personalized Learning Paths: A brief initial survey tailors tutorials specifically to each user’s experience and financial goals, ensuring relevance and effectiveness. - Engaging, User-Friendly Tutorials: Clear, concise content blends real-life examples with humor and clarity, making complex concepts like Two-Factor Authentication (2FA), password managers, and hardware wallets easy to grasp. - Secure Self-Custody Training: Emphasizing the foundational Bitcoin principle of “Not Your Keys, Not Your Coins,” the platform teaches users how to securely hold their Bitcoin. - Interactive Tools & Resources: Quizzes, infographics, checklists, and step-by-step guides help users navigate the Bitcoin landscape confidently.

Expert Insights & Media Availability LearnBitcoin.com invites media outlets, journalists, and podcasters interested in exploring Bitcoin fundamentals, security best practices, emerging market trends, or decentralized finance topics to connect directly with Ian Treibick for expert insights and engaging conversations. About Ian Treibick Ian Treibick is a seasoned Bitcoin advocate and educator with extensive experience in Bitcoin, Lightning, peer-to-peer mining (p2pool), and early-stage ASIC mining. His decade-long involvement positions him uniquely to discuss technical insights, industry trends, and practical Bitcoin security. About LearnBitcoin.com Based in New York, LearnBitcoin.com simplifies Bitcoin education through personalized, community-driven learning experiences. Its mission is to empower individuals with the tools, knowledge, and confidence required for true financial sovereignty. Media Contact: - Ian Treibick - CEO & Founder,

- Metaplanet stock price surged over 20% today. - Metaplanet purchased an additional 497 Bitcoins earlier today. Metaplanet stock price jumped more than 20% today after the firm announced its latest purchase of 497 Bitcoins. Japan's firm has been circling around the media for its relentless BTC purchase since last year. Despite the market price swings triggered by Trump's tariffs and crypto announcements, Metaplanet remains committed to BTC purchase. Metaplanet stock price has been going on a downtrend for the past few weeks. However, it witnessed a more than 20% surge today following the announcement of the BTC purchase. One Meta planet share price is currently valued at 4,045 JPY, which was close to 3,400 JPY earlier today. *Metaplanet Purchases Additional 497 \$BTC*
pic.twitter.com/HActZWEduo "Metaplanet Inc. (@Metaplanet_JP) March 5, 2025 Meta planet revealed its latest Bitcoin purchase on its official X account. CEO Simon Gerovich also confirmed the purchase, stating that the firm spent \$43.9 million and acquired 497 BTC. The average price of Bitcoin in this purchase is approximately \$88,448. Metaplanet Continues its BTC Purchase to Achieve 10,000 BTC by 2025 Metaplanet achieved a year-to-date BTC yield of 45.1% in 2025. So far, the Japan-based firm has acquired 2888 BTC for \$240.2 million at an average BTC price of \$83,172. Whales and major global firms such as Strategy are taking advantage of the present market dips and accumulating Bitcoins. The firm reached a total 0.01% of BTC supply by the end of February after purchasing 68 Bitcoins. It revealed ambitious goals of acquiring 10,000 BTC by the end of 2025 and 21,000 Bitcoins by the end of 2026. Metaplanet acquired 156 Bitcoin in its earlier purchase a couple of days ago. Bitcoin is currently trading at \$88,463 with a slight recovery of 5.68% in the last 24 hours. After Trump's announcement regarding crypto reserve hype faded off, the crypto market lost over 10% market cap. Meanwhile, Trump's new tariffs will also adversely impact the market. However, Bitcoin and altcoins are showing signs of recovery today. Highlighted Crypto News Today: El Salvador Refuses to Halt Bitcoin Accumulation Under IMF Deal

- From 2020 to 2024, Ricardo Salinas raised his Bitcoin investments from 10% to 70% stake. - Mexico's banking authority slowed down the implementation of Bitcoin into Banco Azteca's operations. - Metaplanet and El Salvador buy more Bitcoin signaling global adoption. Mexican billionaire Ricardo Salinas has allocated 70% of his total investment portfolio to Bitcoin and Bitcoin-related assets. During his March 4 Bloomberg interview, the founder and chairman of Grupo Salinas discussed his current investment strategy. During 2020 Salinas maintained Bitcoin as 10% of his portfolio, but he increased his holdings in 2022. The number of bitcoin Salinas owned grew to 60% in April 2022. Now, he is "pretty much all in" on Bitcoin, with the remaining 30% of his portfolio distributed to gold and gold miners. The businessman emphasized Bitcoin's fixed supply, calling it the "hardest asset in the world." He also recommended a long-term approach, suggesting investors buy Bitcoin gradually through dollar-cost averaging. Salinas Pushes for Bitcoin Despite Regulatory Challenges Salinas has consistently supported the integration of Bitcoin into Mexico's financial infrastructure for many years. In 2021 he directed Banco Azteca towards becoming the initial financial institution in Mexico to welcome Bitcoin transactions through Grupo Salinas. However, the requested initiative met resistance from regulatory authorities which caused a delay. Salinas maintains his dedication to implementing Bitcoin adoption processes. He revealed his intention to split the financial services and retail company Grupo Elektra from Grupo Salinas. The division would permit him to oversee Grupo Elektra as an independent entity. Salinas, with a net worth of \$4.6 billion, has long expressed concerns about traditional financial systems. Bitcoin received strong endorsement from Salina who invested most of his wealth into this decentralized form of currency. He stated officially that all his investments are limited to the assets within his businesses. Bitcoin Holdings Surge Among Corporations and Governments Salinas is not the only major entity increasing Bitcoin exposure Metaplanet recently acquired 135 Bitcoin for \$13 million at an average price of \$96,185 per BTC, making it the 14th largest corporate Bitcoin holder globally. Meanwhile, El Salvador expanded its Bitcoin reserves by purchasing seven Bitcoin on February 24, surpassing its usual daily average of one. The country's National Bitcoin Office highlighted this increase as part of its broader Bitcoin strategy. The rising number of institutions that invest in Bitcoin demonstrates a worldwide movement in investment patterns. The financial role of Bitcoin grows stronger because more corporations and governments buy Bitcoin. Highlighted Crypto for Today Highlighted Crypto News Today:

- Bukele insists Bitcoin accumulation will continue despite IMF restrictions. - El Salvador added 1 BTC to its reserves on March 4, holding 6,101 BTC. El Salvador's President Nayib Bukele has reaffirmed that the country will continue accumulating Bitcoin (BTC), despite the recent International Monetary Fund's (IMF) agreement suggesting otherwise. Bukele dismissed claims that El Salvador's Bitcoin strategy would stop, countering the IMF's requirements tied to a \$1.4 billion loan deal. The IMF recently released a report stating that the Salvadoran government should halt voluntary Bitcoin purchases. The agreement imposes restrictions on Bitcoin acquisitions, mining, and transactions. It also requires the government to disclose its Bitcoin wallet addresses and liquidate its Fidebitcoin trust fund by July 2025. Bukele responded by posting on X, rejecting the IMF's stance. He stated, "This all stops in April." "This all stops in June." "This all stops in December." No, it's not stopping. The post came after El Salvador added another Bitcoin to its national reserves on March 4, bringing the total to 6,101 BTC, worth over \$530 million. IMF Conditions and El Salvador's Bitcoin Holdings The IMF agreement enforces strict limitations on Bitcoin activities. It mandates a "ceiling of 0" on government Bitcoin purchases and prohibits further involvement in
