

Bitcoin-related economic activities. The IMF emphasized that compliance is crucial for receiving continued funding. Despite these conditions, El Salvador remains committed to its accumulation strategy. The Bitcoin Office disclosed the purchase of 19 BTC in the past week, followed by another acquisition on Tuesday. The country's Bitcoin reserve continues growing, despite the IMF's restrictions. Bukele's stance has received backing from Bitcoin supporters. Strategy chairman Michael Saylor posted, "Bitcoin adoption is unstoppable." Samson Mow also commented on the IMF's restrictions, questioning how they will impact El Salvador's future purchases. El Salvador's Bitcoin strategy began in 2021 when the country made BTC legal tender. Bukele announced in 2022 that the government would buy one Bitcoin daily. Highlighted Crypto News Today Is the Next Big Breakout for AAVE Around the Corner After a 21% Jump?

- Bitcoin has factored in a modest price increase of 3.42% in the last 24 hours. - The cryptocurrency shows a 23.30% dip in daily trading volume as per CMC data. The Asian crypto community has awakened to a modest market revival after the past day's significant crash. Leading cryptocurrencies have witnessed partial gains despite market uncertainty and a lack of bullish momentum. However, the upcoming days hold mounting tensions and more FUD due to shifting economic landscapes. Notably, Bitcoin has gained a modest 3.42% in the last 24 hours, rising to the \$86K range. Moreover, the cryptocurrency also hit an intra-day high of \$88,911 a few hours ago. In the morning hours of March 4, the cryptocurrency was trading at a low of \$83,314, after which it progressed to its current range. Further corroborating this price movement, certain analysts have predicted a rebound in Bitcoin based on chart patterns. Prominent market expert, Ali (@ali_charts) stated that when trader loss margins reach -12% a BTC rebound occurs as per historical data. The current loss margin is at -15.4% which could trigger a reversal. At the time of writing, BTC was trading at \$87,156 as per CMC data. #Bitcoin \$BTC has historically rebounded when the trader loss margin reaches -12%. Right now, it's sitting at -15.4%, signaling a potential reversal! pic.twitter.com/tzbNxY1LIp Ali (@ali_charts) March 4, 2025 However, the global economic landscape is turning rocky amid mounting tensions between nations. Donald Trump's increased tariffs have affected global trade and a recent development has added to complications. Will the Global Economic Dispute Act Bitcoin Bull Run Barrier? In the past few hours, news of Donald Trump's increasing tariffs for India, South Korea, and China. This has further instigated shifts in global trade relationships. Moreover, the last two market crashes resulted from the US president's announcement of tariff hikes. This suggests that the external factor might impose barriers to Bitcoin reinstating its bull run. Moreover, analyzing its technical indicators, the cryptocurrency's bull power indicator stands at 1.61. However, its bear power indicator value stands at -4.09 suggesting bearish control. Furthermore, Bitcoin's RSI value stands at 40.96 as per TradingView data. This further highlights that the digital asset is currently residing in the oversold region. Meanwhile, other altcoins such as XRP and Solana have also shown price recovery.

- The global crypto market cap dropped 8.76% to \$2.77T. - Bitcoin (BTC) is below its 50-day moving average, confirming a bearish trend. The global crypto market is facing a sharp downturn, with the total market cap falling to \$2.77 trillion, an 8.76% drop in the last 24 hours. Market trading volume has also decreased by 15.59% to \$176.55 billion, indicating reduced investor activity. The entire crypto market is bearish, pulling Bitcoin (BTC) down significantly. Bitcoin is currently trading at \$83,093.80, down 9.43% in the last 24 hours. Its market cap has fallen to \$1.66 trillion, reflecting a 9.24% decline. The 24-hour trading volume stands at \$73.6 billion, showing a slight drop of 1.08%. Bearish Indicators For BTC Bitcoin is facing strong resistance at \$86,800. If bulls push the price above this level, BTC could rally toward \$90,000 in the short term. However, failure to break resistance could trigger another sell-off. The first major support level is \$82,500. If Bitcoin fails to hold this level, the next key support sits at \$80,000. A break below this mark could accelerate selling pressure, pushing the price lower. The Relative Strength Index (RSI) is currently at 36.45, indicating oversold conditions. The RSI average is slightly higher at 37.86, suggesting weak momentum. A move above 40 could signal a potential price reversal, but continued downward movement would confirm bearish strength. The CMF (20) stands at 0.02, indicating weak buying pressure. A drop below 0 would confirm increased outflows and lower investor confidence. Bitcoin is currently trading below its 50-day moving average (MA), confirming a bearish trend. The 200-day MA remains a critical resistance level. A bullish crossover, where the 50-day MA moves above the 200-day MA, could signal a trend reversal. However, until BTC reclaims key resistance levels, the market remains bearish. Bitcoin needs to reclaim \$86,800 to shift momentum in favor of bulls. If BTC drops below \$82,500, it could slide toward \$80,000 or lower. Until buying pressure increases, Bitcoin is likely to remain in a bearish phase. Highlighted Crypto News Today GoPlus Security (GPS) Jumps 25% After Binance Listing Announcement

- Hayes believes Bitcoin will recover after a dip to \$70K, potentially reaching \$250K. - Despite market volatility, Hayes remains cautious and prefers gradual purchases over leveraged trades. - Hayes is skeptical about Trump's plan to create a Bitcoin reserve, citing competing demands on federal funds. The BitMEX and 100x co-founder Arthur Hayes predicts Bitcoin will sustain its bull market run despite recent price movement. He suggests that Bitcoin's price might temporarily dip to approximately \$70,000 before experiencing a significant rise. Bitcoin's Potential Dip and Strong Rebound Hayes anticipates a temporary pullback to \$70,000 as a natural market correction. After this dip, he expects Bitcoin to surge back, potentially reaching as high as \$250,000 by the end of 2025. This forecast aligns with his earlier prediction of a significant rebound from lows in the \$70,000 to \$80,000 range. While Hayes acknowledges the uncertainty, he believes a fall toward \$80,000 could present a "dead cat bounce" opportunity for cautious traders who prefer to buy on dips while avoiding leverage. Bitcoin has dropped by 10%, reaching a low of \$83,000, which confirms Hayes's earlier analysis. He points to rising dollar liquidity as a key factor that could propel Bitcoin to its peak around March 2025. Traders focusing on macroeconomic trends will likely notice similar price

movements during this period. Market Volatility and Caution on Leverage Hayes also warns of potential price volatility, suggesting that Bitcoin could face a more severe correction if major indexes like the S&P 500 or Nasdaq 100 fall by 20% to 30%. Such a correction could drag Bitcoin down further before it consolidates and ultimately breaks out. Despite his optimistic long-term view, Hayes remains cautious. He plans to “nibble on dips” rather than using leverage, adopting a conservative strategy of gradually accumulating Bitcoin during price pullbacks. This cautious approach reflects a broader institutional trend, where large investors prefer spot purchases over leveraged trading. As of press time, Bitcoin traded at \$83,690, showing an 8.88% decrease in the past 24 hours. Its market capitalization stands at \$1.65 trillion, with a trading volume of \$73.8 billion. Trump’s Proposed Bitcoin Reserve Faces Doubts Hayes expressed skepticism about the Trump administration’s potential move to establish a strategic Bitcoin reserve. He doubts that the president’s significant borrowing capacity will be used to purchase Bitcoin, given the competing demands on federal funds. Nothing new here. Just words. Lmk when they get congressional approval to borrow money and or revalue the gold price higher. Without that they have no money to buy #bitcoin and #shitcoins. <https://t.co/Q06cDtL6h7>” Arthur Hayes (@CryptoHayes) March 3, 2025 The long-term growth of Bitcoin receives Hayes’s guaranteed prediction but he recognizes risks for short-term volatility including price dips. The way he buys Bitcoin through market declines demonstrates an institutional method for financial institutions. The changing landscape of the market relies on Hayes’s timely predictions which enable traders to handle Bitcoin’s market fluctuations successfully. Highlighted Crypto for Today GoPlus Security (GPS) Reveals Security Threat Behind Ronaldinho Memecoin

- Michael Saylor, once a Bitcoin maximalist, now supports a multi-token crypto reserve, including XRP and Cardano. - Critics argue that Bitcoin should remain the sole reserve asset, questioning the inclusion of altcoins. - The U.S. crypto reserve decision could influence future regulations and reshape market dynamics. Michael Saylor, known for his unwavering Bitcoin maximalism. He has shocked the crypto community by supporting a multi token cryptocurrency reserve that includes XRP and Cardano. In a recent CNBC interview with Sara Eisen, the Strategy co-founder described this development as “bullish” for Bitcoin and the broader digital asset industry. Saylor’s Unexpected Shift on XRP Saylor, who once dismissed altcoins and branded XRP as an “unregistered security,” has now supported the addition of several assets to the U.S. crypto reserve. This follows after the confirmation by former President Donald Trump that the reserve. Which initially concentrated on Bitcoin only, would now add Ethereum, XRP, Solana, and Cardano. The billionaire highlighted that the most important implication of this move is America’s embracing of a progressive digital asset policy, which he opines can unlock a \$100 trillion market opportunity. His attitude implies a possible recognition of XRP’s importance in the changing crypto landscape. Despite Saylor’s backing, the multi-coin reserve has been criticized by some industry leaders. Key Bitcoin proponents contend that Bitcoin alone must be the reserve’s foundation. That is considering it is decentralized and “digital gold.” Gemini co-founder Tyler Winklevoss said that XRP, Solana, and Cardano fail the test of a strategic reserve asset. Meanwhile, Bitcoin critic Peter Schiff, while admitting the store-of-value characteristics of Bitcoin, asked why XRP was included. Charles Hoskinson Defends XRP Cardano creator Charles Hoskinson, a person who has been at odds with the XRP community previously, unexpectedly defended XRP’s place. He was complimentary of its toughness, adding that it had endured ten years of difficulty and built up a robust global network. With the U.S. gravitating towards a more extensive crypto reserve policy, this move has the potential to redefine regulatory and investment patterns in the sector. Whether this will solidify Bitcoin’s grip or validate altcoins is yet to be determined. One thing, however, is certain Saylor’s change of heart marks a significant watershed moment in the crypto world. Highlighted Crypto News Today Bybit CEO Says 77% of Stolen Funds From Bybit Hack Still Traceable

Blockchain innovation is moving at breakneck speed, and this month’s most promising cryptos are setting new standards. Bitcoin Cash (BCH) is making peer-to-peer transactions faster and cheaper, attracting merchants and users worldwide. Meanwhile, Injective (INJ) has secured a strategic partnership with Deutsche Telekom, boosting its network security and institutional adoption. At the center of all this is Qubetics (\$TICS), a rising force in decentralized finance. Unlike other projects that focus solely on transactions, Qubetics is building a multi-chain finance ecosystem, offering seamless access to DeFi, trading, and asset management. Qubetics (\$TICS) “The Future of Multi-Chain Finance Decentralized finance (DeFi) is growing, but fragmented blockchain networks make it difficult for users to trade efficiently. Qubetics is solving this problem with its non-custodial multi-chain wallet, integrating powerful tools like 1inch and SWFT Blockchain. Qubetics Wallet: A Revolution in Multi-Chain Trading Qubetics’s wallet integrates with 1inch, one of the top DeFi aggregators, enabling access to hundreds of decentralized exchanges (DEXs) for optimized trades, unmatched liquidity, and the best possible rates. Users benefit from: - Trades across multiple DEXs - Optimized pricing with 1inch aggregation - A seamless and efficient experience for all traders With these integrations, Qubetics Wallet is evolving beyond a simple crypto wallet—it’s becoming a gateway to the decentralized future. Qubetics is in its 24th presale stage, having sold 495 million tokens to over 22,000 holders, raising \$14.5 million. The current token price is \$0.0976, making it an attractive entry point for those looking to participate in the decentralized financial revolution. The crypto presale is gaining momentum, and analysts predict significant growth. Here’s what backers can expect: - \$TICS at \$0.25 at presale end = 155% ROI - \$TICS at \$1 after presale = 923% ROI - \$TICS at \$5 after mainnet launch = 5018% ROI - \$TICS at \$15 long-term = 15,255% ROI With a rapidly growing ecosystem, Qubetics is one of the most promising crypto projects this year. Bitcoin Cash “The Future of Scalable Payments Bitcoin Cash (BCH) was designed to make transactions fast, affordable, and scalable. Unlike Bitcoin, which suffers from slow processing times and high fees, BCH has positioned itself as a go-to payment solution. Smart Contract Enhancements “Enabling DeFi applications, lending, and staking opportunities. Lower Fees & Faster Transactions “Making BCH ideal for everyday

purchases and cross-border transactions. Merchant Adoption Expanding – Global retailers are integrating BCH for seamless crypto payments. With its growing network and increasing real-world use cases, Bitcoin Cash is cementing its role as the future of digital payments. Injective – Institutional-Grade Blockchain & DeFi Injective Protocol (INJ) is breaking new ground by securing a major partnership with Deutsche Telekom, one of the world’s largest telecom firms. This move boosts Injective’s security, decentralization, and institutional adoption. Deutsche Telekom’s T-Systems MMS is now a validator on Injective’s blockchain. Growing DeFi ecosystem, supporting derivatives trading, lending, and staking. High-profile partnerships with leading blockchain networks and institutional investors. With its secure infrastructure and institutional support, Injective is setting the stage for mass adoption. Conclusion For those looking for top cryptos to buy this month, Qubetics, Bitcoin Cash, and Injective stand out. Whether it’s Qubetics leading DeFi innovation, Bitcoin Cash revolutionizing payments, or Injective securing institutional backing, these projects are driving blockchain forward. The Qubetics presale is still open, and with adoption growing, now is the perfect time to explore these crypto powerhouses. For More Information: - Qubetics: <https://qubetics.com> - Telegram: <https://t.me/qubetics> - Twitter: <https://x.com/qubetics> FAQs 1. Why is Qubetics a top crypto to buy this month? Qubetics integrates multi-chain trading, bridging the gap between DeFi and real-world applications. 2. How is Bitcoin Cash improving payments? BCH has reduced fees, sped up transactions, and expanded merchant adoption. 3. What makes Injective stand out? Injective has secured institutional backing, improving security and decentralization. 4. What is the current price of Qubetics (\$TICS)? Qubetics is priced at \$0.0976 in presale stage 24. 5. When is Qubetics’ mainnet launching? Qubetics plans to launch its mainnet in Q2 2025. The crypto market is experiencing a period of correction, with Bitcoin and major altcoins facing increased volatility. While many investors remain focused on established assets like Bitcoin (BTC), XRP, and Shiba Inu (SHIB), others are shifting toward early-stage projects with higher upside potential. Historically, market dips have presented prime opportunities for investors to accumulate high-growth assets before the next bull cycle. As institutional interest in crypto continues to rise and new sectors gain momentum, some altcoins are emerging as strong challengers to traditional market leaders. Among them, The Last Dwarfs (\$TLD) is capturing attention for its unique Play-to-Invest model and fast-growing ecosystem. But how do these assets compare? Let’s analyze whether Bitcoin, XRP, and Shiba Inu remain the best investments or if newer projects like \$TLD offer greater potential. Bitcoin (BTC) – The Market Leader Bitcoin remains the undisputed leader in the crypto space, holding its position as the most valuable and widely recognized digital asset. Despite its dominance, Bitcoin’s price movements have slowed in recent years, making it less attractive for investors seeking high-growth opportunities. While BTC is expected to benefit from institutional adoption and the upcoming halving event, its already massive market cap limits its potential for exponential gains compared to smaller-cap altcoins. XRP – Regulatory Uncertainty Still Looms XRP has experienced significant volatility due to its legal battles with the SEC, which, despite some victories, continue to create uncertainty. XRP remains a key player in the cross-border payments industry, with strong institutional backing. However, adoption has been slower than expected, and the token’s price has struggled to maintain momentum. While XRP could see gains if legal clarity improves, many investors are looking toward alternative assets with fewer regulatory roadblocks and greater upside potential. Shiba Inu (SHIB) – A Meme Coin Searching for Its Next Catalyst Shiba Inu has solidified itself as one of the top meme coins, driven by an enthusiastic community and recent ecosystem expansions, including Shibarium, its Layer-2 network. However, SHIB’s reliance on social media hype and whale-driven market moves make it a highly speculative investment. While some traders continue to bet on SHIB’s long-term viability, others are shifting toward newer projects with stronger fundamentals and real-world applications. The Last Dwarfs (\$TLD) – A High-Upside Alternative with Real Utility The Last Dwarfs (\$TLD) is pioneering a Play-to-Invest model, transforming the way users interact with crypto. The platform blends Web3 gaming and DeFi, offering a unique Gamified Launchpad where players can mine, battle, and stake tokens while gaining early access to high-potential blockchain projects. \$TLD is still in the presale stage, making it an incredible high-potential opportunity before the next market cycle. The project has already attracted over 300,000 users and raised more than \$100,000, showing strong early traction. Additionally, its deep integration with the TON blockchain and Telegram grants it access to a 900M+ user base, ensuring potential mass adoption and great scalability. Final Thoughts – Is \$TLD the Best Crypto to Buy Today? Bitcoin, XRP, and Shiba Inu remain relevant in the crypto market, but their high market caps and slower growth trajectories make them less appealing for investors chasing high returns. In contrast, The Last Dwarfs (\$TLD) stands out as a fresh investment opportunity, combining gaming, DeFi, and early-stage crypto exposure. With Stage 1 of the presale 98% sold out and major growth catalysts ahead, \$TLD could be one of the most promising altcoins of 2025. For investors seeking the next big crypto with real utility and high upside potential, The Last Dwarfs is a strong contender. Disclaimer: TheNewsCrypto does not endorse any content on this page. - Metaplanet purchased 156 BTC for \$13.4M at an average price of \$85,890 per BTC. - The firm now holds 2,391 BTC, worth \$196.3M, with a BTC yield of 31.8% in 2025. Japanese investment firm Metaplanet has purchased 156 BTC for \$13.4 million, increasing its total holdings to 2,391 BTC. The company acquired the Bitcoin at an average price of \$85,890 per BTC. Metaplanet has been aggressively accumulating Bitcoin since adopting its BTC strategy in April 2024. The company aims to hold 10,000 BTC by the end

of 2025 and 21,000 BTC by 2026. Its total Bitcoin investment now stands at \$196.3 million, with an average cost basis of \$82,100 per BTC. *Metaplanet purchases additional 156 \$BTC* pic.twitter.com/TAC7gFTSEB Metaplanet Inc. (@Metaplanet_JP) March 3, 2025 Following the latest purchase, Metaplanet's BTC yield for 2025 reached 31.8%. The metric calculates the ratio of Bitcoin accumulation to share dilution. In Q4 2024, the company recorded a BTC yield of 309.8%. Metaplanet shares surged 21.15% on Monday, closing at 4,010 yen. The broader crypto market rally contributed to the rise. The company has been funding its Bitcoin acquisitions through bond issuances. In February, it issued 4 billion yen (\$26.4 million) in zero-coupon bonds to EVO FUND. Metaplanet repaid 2 billion yen ahead of schedule by February 19, settling the remaining amount by February 21. On February 27, the company issued another 2 billion yen bond, set to mature on August 26, 2025. Metaplanet Eyes Global Expansion Metaplanet's CEO Simon Gerovich, confirmed that the company received invitations from the New York Stock Exchange (NYSE) and Nasdaq. He stated that Metaplanet is exploring ways to make its shares more accessible to global investors. Metaplanet became the second publicly traded company to buy the Bitcoin dip. The growing trend of corporate Bitcoin adoption has gained momentum. Companies are following the lead of MicroStrategy, which pioneered Bitcoin as a treasury asset. Crypto security firm Coinkite reported that 78 companies worldwide now hold Bitcoin in their corporate treasuries. According to Dom Harz, co-founder of BOB, institutional Bitcoin adoption is accelerating. ETFs have played a key role in this trend. He suggested that corporations might eventually integrate Bitcoin into their core operations. Metaplanet continues to execute its long-term Bitcoin strategy, solidifying its position in the growing corporate adoption of digital assets. Highlighted Crypto News Today Crypto Market Gains 340B After Trump Mentions 5 Cryptos for Strategic Reserve

- Bitcoin surged 8% to peak at \$95,043 after Trump's crypto reserve plan announcement. - BTC is trading at \$91,821.69, with a \$1.82 trillion market cap and a 209% volume surge. Bitcoin surged to \$95,043 on March 3 after U.S. President Donald Trump revealed plans for a strategic crypto reserve. The announcement fueled strong buying, pushing BTC up 8% during an unusual weekend rally. Currently, Bitcoin is trading at \$91,821.69, reflecting a 6.97% gain in the past 24 hours. The total market capitalization has climbed to \$1.82 trillion, marking a 7% increase over the day. Trading volume has also spiked significantly, rising 209.38% to reach \$72.97 billion within 24 hours. The fully diluted valuation now stands at \$1.92 trillion, while Bitcoin's circulating supply remains 19.83 million BTC out of the maximum 21 million BTC. Trump's latest remarks have further energized the crypto community. He reiterated his support for Bitcoin, Ethereum, and major altcoins such as XRP, Solana, and Cardano. By highlighting their role in a proposed U.S. crypto reserve, Trump signaled a pro-crypto stance that encouraged strong market activity. Following this statement, Bitcoin spiked to a peak of \$95,043 on Bitstamp, with weekend liquidity conditions amplifying volatility. Will Bitcoin Surge Further? Market analysts have also noted Bitcoin's recent pullback to \$78,000, which created an opportunity for whale accumulation. Crypto analyst Michaël van de Poppe believes the market has established a local bottom, setting the stage for an expansion phase in the broader crypto space. His sentiment aligns with other traders who see Bitcoin's current price action as a bullish continuation. From a technical standpoint, Bitcoin is testing a critical resistance level at \$93,500. A decisive breakout above this level could drive prices toward the highly anticipated \$100,000 mark. On the downside, support at \$90,000 remains crucial, with a further drop potentially leading to a retest of \$87,500. The Relative Strength Index (RSI) stands at 62.77, indicating bullish momentum but nearing overbought conditions. The RSI average of 55.32 suggests a steady upward trend, while moving averages signal continued bullish momentum. Trader Rekt Capital emphasized the significance of \$93,500 as a confirmation level for Bitcoin's recovery. If Bitcoin stabilizes above this zone, a move toward \$100,000 appears increasingly likely. However, failure to hold \$90,000 may indicate a deeper correction before further upside potential materializes. Highlighted Crypto News Today Football Legend Ronaldinho Joins Crypto With STAR10 Token

- Coinbase CEO Brian Armstrong opines that only Bitcoin is the best option for a US crypto strategic reserve. - Brian Armstrong also suggested creating a market-cap weighted index of crypto assets in case diversity is the priority. The crypto market witnessed a strong comeback in the late evening Asian hours followed by Trump's new announcement. While Bitcoin price rose by around 10% within a few hours, Ethereum, XRP, Solana, and Cardano have also recorded two-digit surges. All credit goes to Trump's new announcement on Truth Social regarding the US crypto strategic reserve. Trump's announcement reads that the proposed crypto strategic reserve would include XRP, SOL, and ADA alongside Bitcoin and Ethereum. It quickly brought a life to the broader crypto market that was on a bearish trend for the past week. Meanwhile, industry leaders expressed their views on social platforms on Trump's statement. Excited to learn more. Still forming an opinion on asset allocation, but my current thinking is: 1. Just Bitcoin would probably be the best option 2. simplest, and clear story as successor to gold 3. If folks wanted more variety, you could do a market cap weighted index of crypto 4. <https://t.co/jv8Gcn8N2S> Coinbase CEO Brian Armstrong posted on X regarding Trump's new plans to include altcoins to the US crypto reserve. Even though he was still forming an opinion on this matter, he expressed his views on his official X account. Brian opines that only Bitcoin would probably be the best option to create a crypto strategic reserve. On the other hand, if people would like to have diversity, a market-cap weighted index of crypto assets is the next best option. But, Brian emphasized that the first option of including only Bitcoin in the US crypto reserve is the simplest and clear story as successor to gold. Trump's New Plans for US Crypto Reserve Receives Comments on Social Platforms Attention of all bag holders is on this one word now. CZ's BNB (@cz_binance) March 2, 2025 Chill guys. No need to overanalyze. More "valuable crypto" are likely to be added over time. More countries will follow. It's a fantastic start of something really good. Be happy. Keep building. pic.twitter.com/rJY53G6s9n Another leading exchange Binance's former CEO CZ also reposted Trump's announcement and shared his thoughts. He asked the audience to chill and not overanalyze Trump's new

plans. He focused on Trump's statement that included, "other valuable cryptocurrencies will be at the heart of the reserve." CZ stated that this move could push other countries to follow and will be the start of something good for the industry. Former Binance CEO might be hoping for BNB to make it to the list of the altcoins that will be included to the US strategic reserve. Otherwise, he might not highlight the single line from Trump's statement. Meanwhile, Trump's new announcement also attracted criticism from other industry leaders, other than the Coinbase CEO. Co-founder of BitMEX, Arthur Hayes stated that there is nothing new in Trump's announcement. He further says, "Let me know when they get congressional approval to borrow money and or revalue the gold price higher. Without that they have no money to buy Bitcoin and shitcoins." Hayes' post speaks the bitter truth, reflecting on the practical possibility of creating a US crypto strategic reserve. Nonetheless, the news has already had a positive impact on the crypto market. Top cryptocurrencies are going on an upward price movement ever since Trump revealed plans to include altcoins in the crypto reserve. Highlighted Crypto News Today: Solana (SOL) Makes Strong Comeback Amid Trump's Strategic Reserve Move

- Swiss National Bank rejects Bitcoin as a reserve currency due to volatility. - Schlegel cites Bitcoin's security risks as it is just software. - A proposal to add Bitcoin to reserves needs 100,000 signatures for a referendum. The head of Switzerland's central bank, Martin Schlegel, has shut down Bitcoin as a reserve currency. Since it is illiquid and extremely volatile. During an interview Saturday in Tamedia media group newspapers, Schlegel quoted that cryptocurrencies do not meet the most pressing requirements a healthy currency must fulfill. Swiss National Bank Rejects Bitcoin Schlegel, became the new president of the Swiss National Bank (SNB) in October 2024. Who added that Bitcoin and other cryptocurrencies are "extremely volatile," making them complicated to be part of a nation's currency reserves. Currency reserves must be very liquid so they can be spent quickly, something that, up to now, is not possible with cryptocurrencies, he believes. The SNB, which has been actively purchasing currency markets in a bid to hold back the appreciation of the Swiss franc. Who believes that cryptocurrencies are still a "niche phenomenon," employed primarily for speculation. Schlegel also referred to security concerns pertaining to digital currencies. Citing the fact that they are, essentially, "just software," and thus susceptible to any attack. Even in the face of all these obstacles, there has been a new popular initiative presented in December 2024 in the Swiss direct democracy. Proposal to Add Bitcoin to Reserves The initiative will force the Swiss National Bank to include Bitcoin in its monetary reserve. The proposal, if implemented, would acknowledge Bitcoin as the most established cryptocurrency within the reserves of the nation. The initiative organizer. However, have until June 2026's end to collect 100,000 signatures to enable a referendum. At the same time, Bitcoin has wildly fluctuated in price. Friday dropped below \$80,000 for the first time since last November of 2024. Down over 25% from its high of almost \$110,000, reached only hours before President Donald Trump was inaugurated on January 20. This drop serves again to demonstrate the problems that the volatility of Bitcoin causes in the handling of world currencies. Highlighted crypto News Today USDT Reigns Supreme on Tron Network, Holding 98.5% Market Share

- Trump's crypto summit announcement triggered the Bitcoin (BTC) price to climb above \$86K. - Still, BTC is facing multiple rejections at \$85K, trading at \$84,809. - Technical indicators and analysts warn of a further decline for Bitcoin. Bitcoin (BTC) is experiencing a tough time, dipping below \$80K and recording an intraday low of \$78,248.92. This significant drop was caused by a mix of political decisions, inflation, and an increase in tariff concerns. U.S. President Donald Trump's recent announcements on the implementation of a 25% tariff on Mexico and an additional 10% tariff on Chinese goods have reduced investor confidence, resulting in massive selloffs and outflows from the cryptocurrency market. It's not only Bitcoin alone, as this environment isn't profitable for major cryptocurrencies as well. Bitcoin Price is now down 18% since Trump's inauguration and 24% from its all-time high of \$108,000. Additionally, Ethereum (ETH), the second largest crypto also suffered a 6% decline on Friday and XRP lost nearly 2% as well, trading at \$2.10. However, the crypto market is trying to recover after Donald Trump announced the White House's first crypto summit, set for next Friday, highlighting his growing support for the industry. At the time of writing, BTC is priced at \$84,947 in the Asian trading hours, reflecting a 6% rally in the past 24 hours. Despite the price surge, Bitcoin's daily trading volume, which was high due to selloffs the previous day, has now declined by around 10% to \$63.36 billion. Also, experts warn that Bitcoin could hit further decline. Steve Sosnick, chief strategist at Interactive Brokers, in an exclusive interview points to Bitcoin's 200-day Simple Moving Average of \$96,536 as a key indicator. If Bitcoin fails to maintain its current market, which is currently at \$85,000, Sosnick believes the next support levels could be in the "high \$60,000/low \$70,000" range. "The last I looked, the CME Fedwatch tool was pricing in two rate cuts this year. I think if those got fully priced out [because of concerns around tariffs], there'd be more downside in the traditional markets than in crypto," Sosnick added. Technical Indicators Points to Bearish Trend for Bitcoin In the BTC/USDT daily chart, Bitcoin's technical indicators confirm a bearish market phase. The MACD signal line is below the MACD line, suggesting downward momentum. Data from CryptoWaves confirms that Bitcoin's RSI currently stands at 46.48, which indicates weak buying pressure. If this trend persists, Bitcoin could struggle to break past resistance levels in the near term. If this trend persists, Bitcoin could struggle to break past the next resistance at \$87,500. A failure to gain momentum above this level may lead to further downside, with the next key support at \$82,000. If Bitcoin holds above \$82,000, it could stabilize and attempt another breakout. However, a breakdown below this level might trigger further losses, potentially testing the \$78,500 support zone. Meanwhile, security concerns are also on the rise. Jameson Lopp, co-founder and chief security officer of CASA, reports a surge in physical attacks against Bitcoin holders. His archive documents over 200 such incidents since 2014, with 11 occurring in 2025 alone. "There's a rough correlation between the number of wrench attacks and the price of Bitcoin," Lopp explains. "As adoption increases, mainstream awareness increases, and as such, the

number of criminally minded people who are aware of it increases," Lopp added. However, in a bid to discuss cryptocurrency futures and adoption, The White House is set to host its first-ever crypto summit on March 7 as the crypto community anticipates pro-crypto policies. Experts point to factors like the potential for a U.S. sovereign wealth fund including Bitcoin or the passage of clear market structure legislation as possible catalysts for future growth.

The crypto market is experiencing major shifts, with Qubetics, Ethereum, and Bitcoin Cash taking center stage for vastly different reasons. Qubetics is leading the charge with its tokenized assets marketplace, offering investors access to fractional ownership of real-world assets. Meanwhile, Ethereum is on shaky ground, losing key price support, while Bitcoin Cash is surging, fueled by ETF speculation and renewed interest in Proof-of-Work cryptocurrencies. With Qubetics smashing through Stage 23 of its presale, investors are rushing to secure \$TICS tokens before the anticipated post-mainnet explosion. These developments make Qubetics one of the top cryptos to join for 2025, as market sentiment continues to evolve. Qubetics: Revolutionizing Asset Tokenization with Blockchain Innovation At the heart of the Qubetics Network lies a groundbreaking tokenized assets marketplace, designed to democratize ownership and investment access. Traditionally, investing in real estate, commodities, equities, and intellectual property required significant capital and complex legal structures. Qubetics is eliminating these barriers through blockchain-powered fractional ownership, allowing investors of all sizes to buy and trade tokenized assets. By converting physical and digital assets into blockchain-based tokens, Qubetics is creating a global investment hub where liquidity, transparency, and accessibility are the defining factors. As more institutions and retail investors embrace tokenized asset trading, Qubetics is emerging as a pioneering force in blockchain finance—and one of the top cryptos to join for 2025. Qubetics Presale Surges as \$TICS Hits \$0.0888—Momentum Builds for 2025! The Qubetics crypto presale is reaching new heights, advancing into Stage 23 with \$TICS priced at \$0.0888. With \$14.2 million raised and 491 million tokens secured across 21,600+ investors, demand for Qubetics is skyrocketing. Market projections indicate a 181.52% ROI before listings, but the real growth potential lies ahead. Analysts predict \$TICS could surge to \$10—\$15 post-mainnet, making it a prime target for investors seeking high-growth opportunities. For those looking to get in before the next big crypto boom, Qubetics is proving to be one of the most compelling investments of 2025. Ethereum (ETH) Struggles as Support Levels Break—Bear Market Ahead? Ethereum's price has collapsed, losing critical support at \$2,400 after a 21% drop in just seven days. This downturn has erased weeks of gains, and if ETH falls below \$2,000, the market could enter a full-blown bearish phase. Analysts are watching \$1,800, a key level last seen in 2023 during the bear market. If Ethereum fails to reclaim bullish momentum, its uptrend could be invalidated, leading to lower price levels. With Ethereum's dominance under pressure, some investors are shifting focus toward emerging blockchain solutions like Qubetics, which offer new value propositions beyond traditional smart contract platforms. Bitcoin Cash (BCH) Rallies on ETF Speculation—Can It Maintain Momentum? While Ethereum struggles, Bitcoin Cash (BCH) surges, driven by ETF optimism and renewed investor interest in Proof-of-Work (PoW) altcoins. The U.S. Securities and Exchange Commission (SEC) has played a pivotal role in reviving the altcoin market, especially after acknowledging filings for Litecoin and Ripple ETFs from Grayscale. As investors price in a 90% chance of Litecoin ETF approval, demand for Bitcoin Cash has skyrocketed, with traders speculating that BCH could be next in line for ETF consideration. With institutional money flowing into PoW-based assets, Bitcoin Cash is emerging as one of the most watched altcoins in 2025. If ETF approvals continue, BCH could see even bigger price gains, cementing its place among the top cryptos to join for 2025. Conclusion: Where Are the Biggest Opportunities? As the crypto market heads toward 2025, Qubetics, Ethereum, and Bitcoin Cash present distinct opportunities and challenges. Qubetics is on the rise, leading the tokenized assets revolution, offering fractional ownership of real-world investments through blockchain. Its booming crypto presale and expected post-mainnet explosion position \$TICS as a high-growth contender. Ethereum is at a critical juncture, with its bullish momentum fading. If ETH fails to hold \$2,000, it could enter a prolonged bear market, raising concerns about its short-term outlook. Bitcoin Cash is gaining traction, fueled by ETF speculation and rising demand for PoW-based altcoins. With institutional investors eyeing BCH as a potential ETF candidate, its price could see sustained gains throughout 2025. Qubetics stands out as a game-changer in blockchain finance for investors looking for the best crypto opportunities, while Bitcoin Cash offers ETF-driven upside potential. The market is evolving fast, and those who position themselves early could reap massive rewards in the coming months! For More Information: - Qubetics: <https://qubetics.com> - Telegram: <https://t.me/qubetics> - Twitter: <https://x.com/qubetics> Disclaimer: TheNewsCrypto does not endorse any content on this page. If you're considering which altcoins to buy and hold for short-term profits, you're in the right place. Cryptocurrency, a world once dominated by Bitcoin, has exploded into a vast array of coins and tokens. While Bitcoin still remains the king, other contenders like Ethereum and the rapidly rising Qubetics are catching attention for their potential. Each of these coins offers distinct features and advantages, but how do they compare when it comes to short-term potential? Let's dive into the specifics of each. Bitcoin has long been the face of the crypto industry. Its stability, brand recognition, and history of growth have made it the go-to choice for those seeking long-term gains. However, for those looking to make quicker moves and benefit from some of the new technologies emerging in the crypto world, Bitcoin may not offer the same rapid rewards. That's where Ethereum and Qubetics come in, offering exciting prospects that could deliver big gains in the short term. Now, let's take a closer look at why Qubetics might just be one of the best altcoins to buy and hold for short-term growth—and why it could soon be the talk of the town. It's not just another Layer-1 EVM-compatible blockchain; it's a game-changer that promises to address challenges faced by earlier

projects, offering scalability, security, and a fresh perspective on what blockchain can do for businesses, professionals, and individuals alike. Qubetics: The New Contender to Watch Qubetics is an emerging blockchain that has everyone buzzing. Unlike Bitcoin or Ethereum, which were built with specific goals in mind (Bitcoin as digital gold, Ethereum as a decentralized platform for smart contracts), Qubetics offers something unique: interoperability and a strong focus on scalability. These are the areas where other blockchains have faltered, and Qubetics is here to change that. One of the standout features of Qubetics is its focus on enhancing blockchain usability, allowing businesses, developers, and individuals to create solutions that can easily communicate across multiple blockchain platforms. For example, its Qubetics Wallet is designed to be intuitive, secure, and versatile. This wallet makes it easier for users to hold and transfer tokens securely, providing a seamless experience across various blockchain ecosystems. And, with Qubetics undergoing a detailed blockchain audit by CertiK, one of the most trusted names in blockchain security, confidence in the project's transparency and reliability is skyrocketing. As of the 23rd crypto presale stage, Qubetics has already raised over \$14.2 million by selling more than 491 million tokens to over 21,600 holders. At a price of \$0.0888 per token, analysts predict that Qubetics could see impressive returns—up to 16,791% after its mainnet launch. This gives it a strong advantage for anyone looking to capitalize on short-term opportunities in the crypto market.

Bitcoin: The Unshakable Giant Let's face it: when people think of cryptocurrency, Bitcoin is often the first thing that comes to mind. Known as the first and most established cryptocurrency, Bitcoin's price history is full of highs and lows, but its overall trajectory has been one of growth and acceptance. As a store of value, Bitcoin has proven itself time and again, with the "Bitcoin price" often reflecting broader market trends. It remains the most widely adopted digital asset and continues to enjoy institutional support, making it a solid choice for many crypto enthusiasts. But what about short-term gains? While Bitcoin is a reliable bet for long-term growth, it isn't necessarily the best altcoin to buy and hold for short-term profits. With its massive market cap and established position, Bitcoin's growth tends to be slower compared to altcoins with less market penetration. That said, the Bitcoin price is often seen as a bellwether for the broader cryptocurrency market. When Bitcoin's price goes up, so does the price of many altcoins—including Ethereum and Qubetics. For those seeking quick profits, Bitcoin can still provide opportunities, but it's generally considered a slower mover. However, as a safe bet in the volatile world of cryptocurrency, Bitcoin remains a staple for anyone looking for stability and growth over a longer horizon.

Ethereum: The Smart Contract Pioneer Ethereum, often referred to as the world's programmable blockchain, has been around for a while now and has become one of the most widely used platforms for decentralized applications (dApps) and smart contracts. Its smart contract capabilities set it apart from Bitcoin, which was primarily designed as a store of value. Ethereum allows developers to build decentralized applications, opening the door for innovation across various industries, from finance to gaming. The Ethereum price has seen impressive growth, but similar to Bitcoin, it has had its share of volatility. In terms of short-term buying potential, Ethereum still presents a solid case, especially as it transitions into Ethereum 2.0. This update promises to improve scalability, lower transaction costs, and reduce energy consumption—all of which will make Ethereum even more attractive to developers and users alike. Ethereum's ability to power decentralized finance (DeFi) platforms and facilitate tokenized assets is where its true value lies. This makes it a top contender for those looking to participate in the broader crypto ecosystem and tap into the growing popularity of DeFi, NFTs, and more.

Understanding Qubetics's Interoperability, Wallet, and Blockchain Audit What sets Qubetics apart from both Bitcoin and Ethereum is its focus on interoperability. In simple terms, interoperability means that Qubetics can interact and exchange information with multiple blockchains, including Bitcoin and Ethereum. This opens up a range of possibilities for businesses and individuals to leverage the strengths of different blockchain platforms in one cohesive ecosystem. This is a huge advantage as it addresses the fragmentation that has historically limited blockchain's effectiveness. Qubetics's commitment to security also shines through with its ongoing blockchain audit by CertiK. This audit is designed to ensure that Qubetics's wallet and overall blockchain ecosystem are secure, transparent, and resilient. For those interested in the future of blockchain technology, Qubetics's focus on security and seamless integration between blockchains presents an exciting proposition. CertiK's involvement in the Qubetics audit helps to build trust in the project, as it has already secured some of the biggest names in the crypto space. This audit provides an additional layer of confidence for anyone looking to participate in Qubetics's presale or use its network once it's up and running.

Conclusion: Why Qubetics is the Best Altcoin to Buy and Hold for Short Term While Bitcoin and Ethereum have their own merits, it's clear that Qubetics brings something fresh to the table. Whether it's the emphasis on interoperability, the innovative wallet solution, or the blockchain audit from CertiK, Qubetics has positioned itself as a future-forward blockchain that will cater to the needs of both individuals and businesses. For anyone looking to make short-term profits, Qubetics is hard to ignore. The presale has already raised millions, and the potential for massive returns post-mainnet launch is enormous. If you're looking for the best altcoins to buy and hold for short-term potential, consider Qubetics as a solid addition to your crypto portfolio. With its unique features and promising growth, Qubetics may be the next big thing in the world of blockchain.

For More Information: Qubetics: <https://qubetics.com> Telegram: <https://t.me/qubetics> Twitter: <https://x.com/qubetics> FAQs: - What is Qubetics? Qubetics is a Layer-1 EVM-compatible blockchain focused on scalability, interoperability, and security. - Why is Qubetics's interoperability important? Interoperability enables Qubetics to seamlessly interact across multiple blockchain platforms, enhancing efficiency and flexibility. - How is CertiK involved in Qubetics? CertiK is conducting a thorough audit of Qubetics's wallet and blockchain ecosystem to ensure security and transparency. - Is Qubetics a good altcoin to buy for short-term gains? With a strong presale and impressive potential for growth, Qubetics is a promising choice for short-term gains. - How does Qubetics compare to Bitcoin and Ethereum? Qubetics stands out with its focus on interoperability and scalability, offering unique advantages over Bitcoin and Ethereum for businesses and individuals.

- Bitcoin miner Bitdeer purchased 50 more Bitcoin today. - Bitcoin market price is trading slightly below the \$80,000 mark. Bitcoin miner Bitdeer purchased 50 additional Bitcoins today as the BTC price fell below the \$80,000 level. Bitcoin is trading at \$78,893 at press time with around 9% drop in the last 24 hours. Despite the price drop, proponents are supporting Bitcoin purchase at these lower price levels. Today, we acquired 50 more #BTC at a price of \$81,475 each. #Bitcoin #BitcoinHoldings #BTC #btcmining \$BTDR pic.twitter.com/J0z1DDb8E2 â€” Bitdeer (@BitdeerOfficial) February 28, 2025 Bitdeer announced earlier today that it acquired 50 Bitcoins on its official X account. It purchased these Bitcoins at an average price of \$81,475 each. Even though the Bitdeer purchased BTC at much lower price than its ATH value, Bitcoin price went further below since the purchase. Bitdeer Continues to Purchase BTC Amidst Bear Market Sentiment Bitdeer purchased another 50 Bitcoins at an average price of \$90,280 on Feb 25. Despite the bearish market sentiment, Bitdeer is showcasing its commitment to Bitcoin accumulation. It is one of the renowned Bitcoin mining firms in the world that believes in Bitcoin. Bitdeer recently published its Q4 2024 report in which it discussed its financial results in detail. There was a significant decrease in its total revenue when compared to the previous year. In Q4 2024, Bitdeer recorded \$69 million in total revenue, where this number was \$114.8 million in Q4 2023. Despite the decrease in revenue, Bitdeer is making several strategic plans to expand its operations. For instance, the firm allocated \$250 â€” \$270 millions of capex infrastructure to bring 1 GW of power online in 2025. Furthermore, it spent \$195 million on chips in Q4 2024 and plans to capture a significant ASIC market share in Q1 2025. While Trumpâ€™s tariffs and recent Bybit hack, combined with multiple US states rejecting the Bitcoin reserve bill, crypto market is facing a downturn. While Bitcoin is trading much below its ATH, its proponents are advocating Bitcoin accumulation at the current prices. Highlighted Crypto News Today: MetaMask Announces Bitcoin and Solana Support Improving Multi-Chain Access

- Bitcoin & Solana Integration: Native support for BTC in Q3 2025 and SOL in May. - Users can pay fees with any token, reducing ETH dependency. MetaMask has unveiled a major expansion, adding support for Bitcoin and Solana. The announcement at ETHDenver marks a shift from its Ethereum-exclusive model. These updates aim to unify digital asset management across multiple blockchains. MetaMask will introduce Bitcoin support in Q3 2025. Users can store, send, and swap BTC natively without needing separate wallets. Solana integration will roll out in May, making it the first non-EVM chain on MetaMask. This update will enable users to access Solanaâ€™s ecosystem, interact with dApps, and swap tokens seamlessly. Programmable Accounts and Smart Transactions MetaMask is launching programmable accounts with Ethereumâ€™s Pectra upgrade. This feature introduces built-in multi-sig, two-factor authentication (2FA), and AI-powered delegated access. The platform will also support ERC-5792 batched transactions, allowing users to execute multiple actions in one click. This will reduce gas fees and simplify transactions. In March, MetaMask will introduce gas fee payments using any token. This eliminates disruptions caused by low ETH balances. The update also enhances security against front-running bots and MEV sandwich attacks. Reports suggest MetaMask swaps have already reduced these risks significantly. MetaMask Metal Card and Multichain API The MetaMask Metal Card is receiving an upgrade. Users will enjoy enhanced rewards and exclusive features. The wallet provider is also launching a multichain API in June. This will allow dApps to connect to multiple networks, improving interoperability. Users managing multi-chain portfolios will benefit from this streamlined approach. MetaMask is adding support for multiple Secret Recovery Phrases (SRPs). Users will also experience profile sync across devices. Additionally, a redesigned home screen will display all assets across different chains in one place. The company plans to eventually eliminate gas fees for users. Smart transaction features will prevent failed transactions and protect against MEV attacks. MetaMask is also transitioning from Externally Owned Accounts to smart contract-based accounts. This will improve asset management and security. Highlighted Crypto News Today Deutsche Telekom Unit Joins Injective Blockchain As a Validator

- Bitcoin dropped below \$80K for the first time since November, reaching a low of \$78,984.63. - The crypto market declined, with ETH, SOL, and XRP dropping over 7%. Bitcoin has dropped below \$80,000 for the first time in over three months, marking a sharp reversal from its post-election rally. The decline comes amid macroeconomic uncertainty and concerns over U.S. President Donald Trumpâ€™s proposed tariffs. Bitcoin is trading at \$80,050, rebounding slightly after hitting a low of \$78,984.63. The market cap stands at \$1.57 trillion, while the market cap ratio is 4.38%. The 24-hour trading volume is \$70.72 billion, showing a 1.27% increase. Bitcoinâ€™s sharp drop follows a broader market sell-off. On January 20, BTC reached an all-time high of \$109,241, the day of Trumpâ€™s inauguration. Since then, it has fallen 26%, erasing most of its post-election gains. Bitcoin is facing resistance at \$82,000. If BTC breaks this level, it could push toward \$85,000. However, \$78,000 remains a key support level. A break below that could lead to a further drop toward \$70,000. Bearish indicators for Bitcoin (BTC) The RSI is at 66.59, indicating that BTC is approaching overbought territory. The RSI average of 58.75 suggests strong momentum, but a correction may occur if buying pressure weakens. The moving averages indicate an uptrend, with a bullish crossover forming. This suggests Bitcoin could continue its recovery if price levels hold. The CMF stands at 0.42, showing that buying pressure remains strong. This signals capital inflows, supporting Bitcoinâ€™s stability despite recent price swings. Despite volatility, institutional investors remain bullish. Geoffrey Kendrick, Standard Charteredâ€™s Head of Digital Assets Research, expects Bitcoin to hit \$200,000 in 2025 and \$500,000 before Trumpâ€™s second term ends. The crypto market is also feeling the effects of Bitcoinâ€™s decline. Ethereum (ETH) fell 7.3%, Solana (SOL) dropped 7.1%, and XRP slid 7.8%. Adding to Bitcoinâ€™s troubles, U.S. Bitcoin ETFs saw a record \$1 billion outflow, intensifying selling pressure. Bitcoinâ€™s price is at a crucial level. If BTC holds above \$80,000, it could push toward \$85,000. However, breaking below \$78,000 may lead to further losses. Traders remain cautious as macroeconomic factors and regulatory shifts shape Bitcoinâ€™s trajectory.

A Powerhouse Partnership for Bitcoin-Backed Lending Debifi, the pioneering platform for non-custodial Bitcoin-backed loans, is thrilled to announce a strategic advisory partnership with Preston Pysh—co-founder of The Investor’s Podcast Network and a leading voice in Bitcoin advocacy. This collaboration accelerates Debifi’s mission to establish Bitcoin as the ultimate collateral, leveraging trust-minimized, overcollateralized lending that upholds Bitcoin’s core principles. Why This Changes the Game Preston Pysh has long championed overcollateralized lending as the ultimate shield against systemic risk in Bitcoin ecosystems. Now, his expertise will steer Debifi’s vision, blending strategy and education to:

- Mitigate systemic risk with ironclad overcollateralization standards.
- Educate the masses on the perils of fractional-reserve pitfalls and the power of trust-minimized lending.
- Drive institutional adoption with secure, transparent financial frameworks.

Preston Pysh’s Take: Overcollateralization is Non-Negotiable Systemic Risk Smasher: “The moment a bitcoin lender goes >1:1 collateralization ratio, they’re introducing systemic risk into the system. Overcollateralization ensures lenders are never exposed to losses, creating a trustless environment.” Pysh also slams rehypothecation as a dangerous betrayal of Bitcoin’s principles. P2P Lending Done Right: “Peer-to-peer lending with overcollateralization and no commingling of collateral is the lowest-risk way to conduct borrowing. You know exactly who the other side of the trade is, and the collateral is liquid and transparent.” Compare that to the murky risk pools of traditional fractional-reserve setups. Debifi’s CEO Weighs In Max Kei, CEO of Debifi: “We’re excited to have Preston Pysh as an advisor. His expertise in systemic risk mitigation and innovative financial models aligns perfectly with Debifi’s mission. Together, we’re reinforcing Bitcoin’s role as the dominant global collateral—free from the mismanagement seen in traditional finance.” Growth on Fire:

- Last quarter: 5x surge in new loans, 2x growth in lenders.
- This quarter (with fiat loans live): Applications doubled, client base is set to triple by the quarter’s end.

What’s Next? With Pysh in the mix, Debifi’s charging ahead:

- Rolling out Bitcoin-backed lending products with no rehypothecation and crystal-clear risk models.
- Delivering seamless institutional liquidity.
- Dropping joint market analysis, thought leadership, and bold advocacy for Bitcoin as the ultimate financial asset.

Dive deeper: Visit debifi.com. About Preston Pysh Preston Pysh is a renowned Bitcoin advocate, co-founder of The Investor’s Podcast Network (TIP), and a leading voice in financial education. A dedicated proponent of Bitcoin as the world’s premier asset, Pysh actively supports its adoption through investment, research, and advisory roles. He can be found sharing insights on The Investor’s Podcast Network and engaging with the Bitcoin community on Nostr. About Debifi Debifi is a non-custodial lending platform designed to unlock Bitcoin’s potential as a superior collateral asset. Through secure multisig escrow and no-rehypothecation lending, Debifi offers individuals and institutions unmatched borrowing solutions. BlackRock’s iShares Bitcoin Trust (IBIT) saw \$420 million in withdrawals on February 26, marking its largest single-day outflow to date. Investors pulled 5,000 BTC, surpassing the \$332 million outflow recorded on January 2. As Bitcoin’s price dropped to \$86,263, the broader market also showed signs of uncertainty. The sell-off extended across major Bitcoin ETFs, pushing total outflows past \$3 billion over the past seven trading days. Fidelity’s Wise Origin Bitcoin Fund (FBTC) recorded \$145.7 million in withdrawals, while other funds, including Bitwise, Ark 21Shares, and Grayscale, reported outflows ranging between \$10 million and \$60 million. With Bitcoin ETFs facing outflows, investors are turning to emerging crypto projects. Aural One (DLUME) is drawing interest through its ongoing presale, backed by blockchain gaming and metaverse integration. As market participants seek alternatives, Aural One is gaining recognition as the best crypto coin to buy in 2025.

5 Promising Crypto Coins to Watch

- Aural One (DLUME)** Aural One is a blockchain network on its way to launching, and is built specifically for gaming and metaverse applications. Focusing on low gas fees and fast transaction speeds, it is aimed at ensuring not only a good user experience for developers but also for gamers. Click here to know more about Aural One During its presale, Aural One, in return for joining, is giving out its native token, DLUME, which will be used in in-game economies, staking systems, and other incentives. Presently, DLUME is sold at \$0.0011, and the presale is organized into 21 rounds, where the price is increased step-by-step gradually. Aural One’s premier game, Clash of Tiles, will allow players to experience the throughput of the network, with the plans to extend the universe by launching projects such as DarkLume. By integrating Zero-Knowledge Rollups, Aural One targets security and scalability, which may provide an advantage to blockchain-based gaming environments.
- DexBoss (\$DEBO)** DexBoss seeks to make decentralized finance (DeFi) easier for the average person, thus bridging the gap between classical finance and blockchain-based trading through its services. Alongside user-friendly interfaces and liquidity solutions, DexBoss provides margin trading and liquidity farming, which are tools that cater to people at all levels of trading development. The \$DEBO token is the central element in the platform and its full supply includes 1 billion tokens. The lowest presale price shall be \$0.01 and it will go up progressively until the 0.0505 target price is reached. There are 17 rounds, each with a predetermined price. DexBoss also features a mechanism for users to have opportunities from the repurchase and burning. In case of platform launch in Q2 of 2024, DexBoss has for its target to become a place through which DeFi usage will literally get faster.
- Chainlink (LINK)** One of the many key properties that link provides in the crypto world is that it connects blockchains and real-world data. Chainlink is the de facto standard, which stands as an irreplaceable part of the tokenization process. At the same time, blockchain technology and smart contracts are kind of sensitive things that have their ups and downs, but both need each other to thrive. Chainlink’s system ensures that security and trust are present

while also admitting that there would be room for more innovation. Oracles can be compared to two-way cable transmissions, they provide data to smart contracts, and receive information from another way as well. Chainlink is one of many projects that power dApps, and yet, its role in blockchain is one of the most variable and agile ones. Support for Chainlink is growing due to the fact that developers feel more empowered when they can tap into different decentralized modes and associations. Furthermore, upcoming developments will see considerably more novel applications of the blockchain technology.

4. Cardano (ADA) Cardano's strategy made it unique and independent from Ethereum, Bitcoin, and other cryptocurrencies. Eventually, the network will become obsolete if it is not kept up to date. Cardano is the result of a series of innovations in cutting-edge research, targeting a network style that has mostly been forsaken by its contenders. These key terms such as governance systems or an improvement in smart contracts are the most crucial issues. Futuristic solutions are, in fact, the golden rule of the lifecycle of blockchain. One of the most relevant applications for real-world applications and smart contracts is due to the increasing sophistication of decentralized applications. IoT and AI stand as the most critical frontiers and optimizations, making decentralized applications much more sophisticated. Cardano will be the first to create a multifunctional network, which will comprise its own native dApps, DeFi apps, and dApps that incorporate external blockchains. Valuations will be lower than those recorded in the past, but no one can let this prevent them from taking the desired actions. Cardano is a top-ranked public blockchain platform, with an ongoing strategy to boost the utility of its cryptocurrency, ADA and to realize its operational purpose globally; it will take the network to the next level.

5. Polkadot (DOT) Polkadot is a unique platform with its multi-chain architecture, which allows synchronization of different blockchains and the transfer of assets between them without interfering with the security level. The Polkadot owned interoperability is what makes the *Entschoß transferungen* so important to the future of this technology, solidifying the platform as a significant contributor to a more interconnected blockchain network. Celebrated changes in the network serve to expand the operability of on-chain facilities so that the features of scalability, governance, as well as varying sets to a developer are essential when building start-ups and established projects that are ready for the multi-chain environment are all achieved.

Conclusion Thus, cryptocurrency space is full of the birth of many opportunities which points to different areas- from the gaming industry, through decentralized financial platforms, to building more stable infrastructure. The projects like Aural One (DLUME) and DexBoss (\$DEBO) are prime examples of the most creative and innovative blockchain gaming platforms and DeFi usability while conglomerated heavyweights like Chainlink, Cardano, and Polkadot are developing and spreading their utility to the market as well. These cryptocurrencies are centered around various use cases that are ideal for the exploration of different blockchain projects. Thus, they might be the key to the transformation of digital money and decentralized economies.

GameStop reviews Bitcoin as a major investment opportunity after Strive Asset Management made its recommendation. The company faces an ongoing challenge to improve shareholder value because it possessed \$4.6 billion in cash during Q3 2024. Strive CEO Matt Cole recommended that GameStop allocate its cash to Bitcoin, aligning with trends in the market. Strive Asset Management wrote to CEO Ryan Cohen to express their recommendation for GameStop to start Bitcoin investments. Cole advocated that Bitcoin could serve as an inflation shield for GameStop which would enable the company to become the industry leader in gaming. GameStop continues to assess digital assets because its sales have declined by 20% in Q3 2024. GameStop utilized cryptocurrency by offering NFT marketplace services and digital wallet solutions in the past. The company decreased its NFT operation following unclear regulations which forced it to discontinue its crypto wallet product in 2023. The strong Bitcoin interest continues to thrive following Cohen's recent meeting with Michael Saylor who co-founded MicroStrategy. GameStop's board made changes to the investment policy in January that provided Cohen and his team with increased freedom to choose their investment targets. The policy amendment provides the company an opportunity to investigate fresh financial techniques such as cryptocurrency ventures. GameStop will determine its gaming sector along with financial sector performance by implementing this decision. Through Bitcoin investment, the company can upgrade its asset-handling procedures. As top cryptocurrency investments continue gaining traction, projects like Aural One and others listed below, are also emerging as industry leaders, offering innovative financial solutions. Given the current fleet of digital assets, we have startups that use a new technology and interact with the community. Through this article, various promising cryptocurrencies are projected. \$META, Aural One (DLUME), Doge Uprising (\$DUP), DexBoss, and The Last Dwarfs (LTD) are the five projects that point out the space's worthiest applications. Aural One (DLUME) Aural One (DLUME) that is a blockchain for gaming and metaverse is one of the key features that is responsible for the high speed of transactions and the low gas fee. The utility of the native DLUME token lies in processing the transaction with the ecosystem and it implements in-game be the unit of money. In the first phase, the price begins at \$0.0005 and gradually grows to \$0.0045 by the 21st Round. Click here to know more about Aural One DLUME tokens are eligible for yield farming and staking whereby their owners are also eligible to participate in governance. Aural One utilizes the Zero-Knowledge Rollups technology, thus, it keeps scalability at an optimal level, which is a necessary requirement in gaming applications. The platform is moving well with the first game, Clash Of Tiles indicating there are possibilities in the platform to be discovered. DexBoss (DEBO) DexBoss (DEBO) is the decentralized finance (DeFi) that has a slogan of "tilling the soil" between conventional finance and the DeFi sector. It does so by preaching the word of liquidity pools that are deep enough to avoid slippage and offer the charts advanced features like margin and liquidity farming. Including 50% set aside for the pre-sale total supply of 1 billion, DEBO was produced. Through buyback options " that entails distributing DEBO tokens proportionate to

the amount of tokens burned with about 2.5 years – it will bring huge long-term value out of its token. It has been observed that the price started at \$0.01 and then it climbed to \$0.0505. Moreover, its bright future perspectives like the listing of its token on a large platform make it a promising DeFi solution MetaConnect (\$META) MetaConnect (\$META) is a metaversal project that falls under the category of social and gaming virtual connections and social engagements that are participating where creators and gamers can reach out to support and interact with each other. In case the specific pricing or presale details are not announced, the focus of the project on the metaverse in general coincides with the increasing demand for immersive digital experiences. Doge Uprising (\$DUP) Doge Uprising (\$DUP) is a community-driven cryptocurrency whose success is driven by the power of the meme-culture. Not being able to view details such as presale is one of the negatives, but Doge Uprising can profit from the already established trend of memes that have the potential to grow in a niche market. The Last Dwarfs (LTD) Since a time The Last Dwarfs (LTD) has been able to break away from the pattern of forbidden activities in games, crowd-driven storytelling, which is connected to a fantasy theme, is emerging as the new tr. The only mention of the project’s engagement-with-the-new-is-this was given, but the company is about stimulating the active participation of the community and using the blockchain technology (BC). Stories from the blockchain technology world are fused with traditional storytelling forms and are made more interactive by the community. Conclusion The Aureal One (DLUME) token with a metaverse focus, advanced technological framework, and community engagement strategies is a great investment opportunity among the tough competition in the crypto sector. You get very substantial returns for your early investment in the presale. This matches perfectly with the increasing demand for scalable blockchain solutions. On the contrary, DexBoss (DEBO) can also be considered, as it is shown as a very strong competitor in DeFi as it can easily reach the clients by addressing the main challenges and offering advanced trading features. Both these tokens show that blockchain investment opportunities are changing. Besides, they can make a lot of money. Other technological advancements and community platforms may set the pattern for the next wave of cryptocurrency investment. They will be followed by investors to keep up with a project’s developments and creation of innovative technologies that can shift the direction of the currency market Disclaimer: TheNewsCrypto does not endorse any content on this page. - Bitcoin is still in its early adoption at 3% in 2025. - Bitcoin adoption witnessed a dramatic shift in 2024, driven by BTC ETF approvals. Bitcoin is one of its kind global assets that gained traction steadily over the years. When it was first introduced in 2009 by an anonymous person named –Satoshi Nakamoto,– only tech geeks knew about it. What started as an experiment years back has now become a powerful force that could change the fate of the global economy. The political environment of the US had a significant impact on Bitcoin market price by the end of 2024. When Donald Trump won US elections in Nov 2024 and promised to make the US the crypto capital of the world, the crypto market witnessed a significant bull run. Bitcoin even reached an all-time high of over \$108K in December 2024. However, Bitcoin is trading at \$88,383 at press time much below its ATH value. Uncertain macroeconomic conditions combined with multiple US states rejecting the Bitcoin reserve bill are driving BTC price downward. Despite the market price movements, BTC adoption has gradually increased over the years. Bitcoin Adoption is Just Started, as per River Intelligence The recent report by River Intelligence found out that Bitcoin adoption is at 3% in 2025. This indicates how early BTC adoption is despite being around since 2009. Some of the key metrics that indicate this adoption are Total Addressable Market (TAM), institutional underallocation, and global ownership. The report further emphasised that Bitcoin adoption resembles the growth and adoption of the internet despite being an asset. Bitcoin is at a stage in 2025, where the internet is in 1990, social media is in 2005, and online banking is in 1996. As per the extrapolated graph, Bitcoin is set to witness a humongous growth in adoption in the upcoming years. Highlighted Crypto News Today: Crypto Market Dip a –Tactical Retreat, Not a Reversal,– Says Binance CEO Richard Teng

- U.S. spot Bitcoin ETFs experienced six consecutive days of negative flows, with a record outflow of \$938M. - With only four days of net inflows, February has seen over \$2.4B exit U.S. Bitcoin ETFs. U.S. spot Bitcoin exchange-traded funds (ETFs) faced a significant setback on February 25, reporting their largest-ever daily net outflow of approximately \$938 million. This downturn follows a broader crypto market rout that has seen Bitcoin’s price falter, trading below the crucial \$90,000 mark. In total, the 11 Bitcoin funds experienced a cumulative net outflow of \$937.9 million, marking their sixth consecutive day of negative flows, according to Sosoalue. This troubling trend comes as Bitcoin’s value dipped by 3.4% over the last day, reaching a low of \$86,140 from an intraday high of over \$92,000. Notably, the Fidelity Wise Origin Bitcoin Fund (FBTC) led the outflows with a staggering \$344.7 million. Meanwhile, BlackRock’s iShares Bitcoin Trust (IBIT) followed closely, losing \$164.4 million. Additionally, the Bitwise Bitcoin ETF (BITB) saw a decline of \$88.3 million, while Grayscale’s two funds accounted for a combined loss of \$151.9 million. Grayscale’s Bitcoin Trust (GBTC) lost \$66.1 million, and the Bitcoin Mini Trust ETF (BTC) lost \$85.8 million. So far in February, over \$2.4 billion has exited these ETFs, with only four days of net inflows noted. Market Dynamics Drive Bitcoin ETF Outflow ETF Store President Nate Geraci commented on the situation, expressing amazement at the traditional finance sector’s ongoing skepticism toward Bitcoin and crypto. He noted that despite downturns, Bitcoin’s long-term viability remains intact. Analysts like BitMEX co-founder Arthur Hayes have pointed out that many Bitcoin ETF investors are hedge funds seeking arbitrage yields rather than long-term holders. Hayes predicted that if outflows continue, Bitcoin could dip to \$70,000. He explained that hedge funds often go long on ETFs while shorting CME futures to generate higher yields, but this strategy falters when yields decrease, prompting these funds to sell their ETF positions. Research from 10x Research head of research Markus Thielen supports

this, indicating that over half of the spot Bitcoin ETF investors engage in arbitrage trading. According to Thielen, this unwinding process is market-neutral and minimizes directional market impact. Overall, the record outflows from U.S. spot Bitcoin ETFs reflect not only market volatility but also the strategic adjustments by institutional investors in response to shifting market conditions. Highlighted Crypto News Today Raydium (RAY) Falls 40% Amid PumpFun's Automated Market Maker Rumors

- Bitcoin (BTC) drops below \$89K amid Bybit hack, ETF outflows, and market uncertainty. - Trump's tariffs on Canada and Mexico add pressure to global markets. Bitcoin (BTC) fell to \$86,008.23 before recovering slightly. It is now trading at \$88,763.49, down 0.15% in the last 24 hours. The market cap stands at \$1.76 trillion, with a 24-hour trading volume of \$81.23 billion, pushing the market cap ratio to 4.75%. BTC is facing immediate resistance at \$90,000, with stronger resistance near \$92,500. On the downside, support sits at \$86,000, with a critical level at \$84,500. A break below \$84,500 could send BTC toward \$80,000, while reclaiming \$90,000 could fuel a push to \$95,000. The Relative Strength Index (RSI) is at 28.98, indicating oversold conditions. The RSI average at 30.20 suggests weak momentum for recovery unless buying pressure increases. The Chaikin Money Flow (CMF) is at -0.03, signaling weak capital inflows. BTC remains below key moving averages, reinforcing the bearish trend. Bybit Hack and Tariffs Weigh on Market Sentiment Bitcoin's decline follows the \$1.5 billion Bybit hack, which has shaken investor confidence. The incident raises concerns over security risks in centralized exchanges. Additionally, Donald Trump's new 25% tariffs on Canada and Mexico, including a 10% tax on Canadian energy exports, have impacted global markets. The uncertainty has led to capital outflows from risk assets, affecting BTC. Bitcoin ETFs have registered \$937.9 million in outflows, marking the largest ever outflows. The broader crypto market is also struggling, with Ethereum (ETH) and altcoins like Solana (SOL), Cardano (ADA), and Dogecoin (DOGE) losing over 20%. Despite the downturn, GameStop is considering BTC as a reserve asset, and states like Ohio and Oklahoma are pushing legislation to allocate public funds into Bitcoin. Public companies acquired 20,569 BTC last week, raising total holdings to 656,762 BTC. Institutional interest remains strong despite short-term volatility. Bitcoin's oversold RSI suggests a potential short-term bounce if buying pressure returns. However, weak CMF and moving averages point to continued caution. A sustained move above \$90,000 could trigger a relief rally, but failure to hold \$86,000 may lead to further downside toward \$84,500 and possibly \$80,000.

- Binance Founder CZ posted a tweet making a recent Bitcoin prediction. - The cryptocurrency has fallen to \$85,000 for the first time in 2025. "Murder Over Crypto Deal" is not an ideal headline that the digital assets community usually wakes up to. However, news of a Chinese citizen killed at a luxury hotel in South Korea has sent alarms across the industry. He was believed to be trading crypto at the time of death. Meanwhile, market conditions have not boosted after yesterday's downfall. Leading cryptocurrencies, initiated by Bitcoin have continued to drop, following the significant shift to \$88K. In the altcoin sector, Ethereum has fallen to \$2.4K, while Solana is nearing the \$100 support level. Although huge liquidations occurred members began referring to Binance founder CZ's 2017 tweet. In the tweet, CZ had stated that he was waiting for a headline discussing the current dip, at a time when BTC was priced at \$19,000. Following this, CZ himself discussed the tweet giving context. Posting a graph from the time, the Binance founder discussed how his thinking was futuristic. After that, he proceeded to post a similar Bitcoin prediction "it crashing from \$1 million to \$985K. Waiting for the new headline: #Bitcoin "CRASHES" from \$1,001,000 to \$985,000." CZ's BNB (@cz_binance) February 25, 2025 Save the tweet. <https://t.co/gLWGtUvYoJ> This prediction received immense interest from the community, similar to other prominent celebrities' \$1M Bitcoin predictions. CZ is the third crypto personality to make such a prediction, after Jack Dorsey and Eric Trump. How Has Bitcoin Realized the CZ Prediction? Five years ago, in 2020 Bitcoin saw a price breakout that caused it to skyrocket from a yearly low of \$4,000 to a high of \$19,000. The cryptocurrency set foot into 2021 with an active bullish trend which remained intact on average throughout the year. However, with the coming of 2022, a historic market crash occurred resulting from the Terra Luna market crash. This caused Bitcoin to fall from a high of \$61K to \$19K. The most recent bull run in 2024, as we recall, saw the digital asset hit the \$100K milestone. Community members who witnessed this growth expressed bullish opinions about CZ's recent tweet. The founder also stated that he has remained bullish for the last 12 years and will continue to remain so. Highlighted Crypto News Today: BTC Analyst Predicts Explosive Bitcoin Move Despite Recent Correction

- Bitcoin has dropped nearly 11% from Monday's highs of \$96,500 to three-month lows below \$87,000 amid heightened macroeconomic and geopolitical concerns. - Highly followed analyst Titan of Crypto contends that Bitcoin remains in a bullish market structure. - Titan of Crypto forecasts an explosive move with a target above \$125,000, representing over 40% upside potential from the current price of around \$87,800. Despite the recent market turmoil and an 11% decline from Monday's peak, prominent analyst Titan of Crypto insists that Bitcoin's underlying bullish structure remains intact. In an X post on Monday, February 24, Titan of Crypto highlighted that Bitcoin is still trading in line with a bullish inverse head and shoulders chart pattern on its weekly chart "a breakout that began in Q4 2024. "The next BTC move could be explosive," he enthused, with his analysis pointing to a main target above the \$125,000 level. At the current price of about \$87,800, this target implies an upside potential of over 40%. Some Bitcoin analysts support the view Other voices in the crypto space support this bullish outlook. Prominent analyst Don Alt described the recent dip on Tuesday, February 25, as merely a test of the range lows on the weekly chart, suggesting that a close above these lows could trigger a bounce next week. Similarly, the advisory from ZeroHedge cautions investors not to be shaken by the current turbulence, noting that Bitcoin is replicating its 2017 run and still has ample room to grow. Supporting these optimistic views, crypto analytics firm CryptoQuant has reported that whales are actively buying the dip, with 26,430 BTC worth over \$2 billion flowing into accumulation

addresses. This influx of whale activity is seen as a positive signal for the market's long-term strength. However, amid the sea of bullish sentiment, Standard Chartered's Head of Digital Asset Research, Geoffrey Kendrick, has urged caution. Kendrick anticipates a further decline in Bitcoin's price closer to the \$80,000 level, advising investors not to rush into buying the dip just yet.

As the cryptocurrency market continues to evolve, meme coins have secured their own space, sparking excitement among both investors and crypto enthusiasts. Among the latest entrants making significant waves are Best Meme Coins to Join Now, Arctic Pablo Coin, Dog (Bitcoin), and Peanut the Squirrel. Each offers distinct narratives and investment opportunities. This article delves into these exciting meme coins, providing insights to help you navigate this dynamic landscape.

Arctic Pablo Coin: Embark on an Icy Adventure

Arctic Pablo Coin (\$APC) isn't just another meme coin presale; it's an invitation to join an exhilarating journey across uncharted icy terrains. Inspired by the adventurous spirit of Arctic Pablo, this token aims to bridge the gap between myth and reality, offering investors a chance to be part of a narrative that uncovers Earth's hidden mysteries. Currently, Arctic Pablo Coin is in its 12th presale location, Penguinopolis, with each phase representing a unique locale in Pablo's expedition. The presale has already amassed over \$1.59 million, reflecting growing investor interest. At this stage, the token is priced at a mere \$0.000067, presenting a golden opportunity for early adopters. Considering the projected listing price of \$0.008, an investment of \$100 now could yield approximately 1,492,537 APC tokens, potentially ballooning to \$11,940.296 upon listing. One of the standout features of Arctic Pablo Coin is its deflationary mechanism. Unsold tokens are burned at the end of each week during the presale, effectively reducing the total supply and fostering a deflationary environment. This strategy aims to enhance the token's value over time, rewarding those who get in early. Moreover, Arctic Pablo Coin offers a lucrative staking program with a dazzling 66% Annual Percentage Yield (APY). As one of the Best New Meme Coins to Join Now, it provides investors with a unique opportunity to maximize their holdings. By staking your APC tokens, you can watch your investments grow while actively participating in the community's journey. All staked coins will be vested for a two-month period from the launch date, ensuring stability and sustained growth. The presale's unique structure, divided by locations rather than traditional stages, adds an element of excitement and urgency. As Arctic Pablo ventures into new territories, the token's price increases, making early participation crucial. With the current stage nearing its end, this is your last chance to invest at this low entry point before prices rise.

Dog (Bitcoin): The Canine Contender

Dog (Bitcoin) (\$DOG) has recently garnered attention in the meme coin market. As of now, \$DOG is trading at \$0.002346, reflecting a 13.35% increase in the last 24 hours. The token boasts a market capitalization of \$234.62 million, indicating robust investor interest. Its fully diluted valuation stands at \$236.47 million, with a 24-hour trading volume surging to \$11.4 million, marking a 65.97% increase. Despite reaching an all-time high of \$0.009947 in December 2024, \$DOG has retraced by 76.23% from that peak. However, it's still up 33.78% from its all-time low of \$0.001768 in August 2024, showcasing resilience in volatile market conditions. With a total and circulating supply of 100 billion DOG tokens, Dog (Bitcoin) remains a key player in the Bitcoin ecosystem's meme coin sector.

Peanut the Squirrel: The Nutty Character

Peanut the Squirrel (\$PNUT), a meme coin on the Solana blockchain, has been making headlines with its recent performance. Currently, \$PNUT is trading at \$0.165406, with a 24-hour trading volume of \$162.93 million. The token has experienced a 10.40% drop in price over the last day but maintains a market cap of \$165.38 million. With a circulating supply of approximately 999.85 million PNUT tokens, the coin's future inflationary dynamics remain a point of speculation. \$PNUT reached an all-time high of \$2.47 in November 2024, reflecting a 93.34% decrease from that peak. However, it has also seen a significant recovery, with a 383.76% gain from its all-time low of \$0.03396 in the same month. This volatility presents both risks and opportunities for investors.

Conclusion

Based on our research and market trends, Arctic Pablo Coin stands out as a compelling opportunity among the Best New Meme Coins to Join Now. Its unique adventure-themed narrative, deflationary mechanisms, and attractive staking rewards make it an enticing prospect for investors. With the presale prices set to rise soon and the current stage nearing its end, this is your last chance to invest at this low entry point. Don't miss out on the opportunity to be part of Arctic Pablo's thrilling journey. Join the Arctic Pablo Coin presale now and embark on an adventure that bridges myth and reality.

For More Information:

- Arctic Pablo Coin: <https://www.arcticpablo.com/>
- Telegram: <https://t.me/ArcticPabloOfficial>
- Twitter: <https://x.com/arcticpabloHQ>

Frequently Asked Questions

- What is Arctic Pablo Coin? - Arctic Pablo Coin (\$APC) is a meme coin with an adventurous narrative, inviting investors to join Arctic Pablo on a journey uncovering Earth's hidden mysteries.
- How can I participate in the Arctic Pablo Coin presale? - Investors can join the Arctic Pablo Coin presale through its official website by purchasing with BNB, ETH, USDT, BTC, SOLANA, XRP, and more.
- Why is Arctic Pablo Coin considered one of the Best New Meme Coins to Join Now? - Its unique presale structure, deflationary mechanism, high staking rewards, and adventure-driven narrative make it an attractive investment opportunity.
- What makes Arctic Pablo Coin different from Dog (Bitcoin) and Peanut the Squirrel? - Unlike traditional meme coins, Arctic Pablo Coin integrates a storytelling aspect where each presale location represents a different stage of Pablo's adventure, making it immersive and engaging.
- Is Arctic Pablo Coin a long-term investment? - With its deflationary model, staking rewards, and increasing presale prices, Arctic Pablo Coin has strong potential for long-term gains, especially for early investors.

- South Dakota rejected the Bitcoin reserve bill, deferring HB 1202. - Volatility and lack of real-time use for Bitcoin are the major reasons behind the rejection. Despite being the largest digital currency in the world, Bitcoin faced a rejection from South Dakota lawmakers. The US state followed

the lead of Montana which also recently rejected the Bitcoin reserve bill concept. Meanwhile, Bitcoin fell below \$90,000 and it is trading above the \$85K mark at press time. Lawmakers of South Dakota disappointed Bitcoin advocates by rejecting the Bitcoin reserve bill. As per the latest update, the House Commerce and Energy Committee saw 9 out of 12 votes favoring deferral of the HB 1202 until the 41st day of the session. The Bitcoin reserve bill proposal was introduced by the State Representative Logan Manhart in South Dakota. It sought to allocate around 10% of the State public funds for Bitcoin investment. This not only adds to the increasing Bitcoin adoption but also diversifies South Dakota investment portfolio. Instead, the State chose not to move forward with the bill. Is Bitcoin Worth of an Investment by the US States Yet? As per the South Dakota Public Broadcasting report, Manhart stated that adding Bitcoin to the State funds is a commonsense way to preserve value. He even emphasized that Bitcoin is useful, especially in inflationary economic environments. On the other hand, State Investment Officer Matt Clark expressed his view of Bitcoin as a volatile and speculative asset. He even stated that Bitcoin doesn't generate any income like other assets. Clark might have not looked at the Bitcoin price chart since its inception or he might have decided to be blind to its growth. Furthermore, Matt Clark highlighted that, "Bitcoin does not have any underlying physical use though. But it does have the advantage of anonymity for those who need that. It also means, if it's anonymous, if it's stolen you will not be able to recover it since it is untraceable." It seems like South Dakota lawmakers need to be educated on digital currencies functionality, immutability, and traceability. The underlying technology of blockchain records every detail of a transaction, making it extremely easier to trace back. On another note, Montana rejected a Bitcoin reserve bill stating its investment is way too risky. Highlighted Crypto News Today: Ethereum's Pectra Upgrade Fails to Finalize on Holesky Testnet

Chicago, Illinois, February 25th, 2025, Chainwire Powerful momentum continues after a record-breaking testnet phase, more than \$300 million in total value locked (TVL), and dozens of ecosystem launch partners. Hemi, a modular blockchain network powered by Bitcoin and Ethereum, today announced that it will launch its mainnet on March 12, 2025. Key Facts - Launching its mainnet on March 12, Hemi is a modular blockchain network designed for superior scaling, security, and interoperability, unifying Bitcoin and Ethereum as a single supernetwork. - Over fifty protocols will be deployed on Hemi, including decentralized exchanges (e.g., Sushi, DODO, Izumi), lending protocols (e.g., LayerBank, ZeroLend), vaults (e.g., Nucleus, Concrete, VaultCraft), top LSTs and LRTs (e.g., Kelp, pumpBTC, StakeStone), oracles (e.g., RedStone, Pyth, Stork), and key dApps (e.g., LayerZero, Pell, BitFi). - Hemi has already attracted more than \$300 million of Total Value Locked (TVL) and announced a \$15 million seed round in September 2024, led by Binance Labs, Breyer Capital, and Big Brain Holdings. - Hemi was founded by renowned early Bitcoin developer Jeff Garzik and blockchain security pioneer Max Sanchez. The transition from testnet to mainnet is a major milestone for Hemi, which has already attracted more than \$300 million in total value locked (TVL) and rapidly built an ecosystem of dozens of protocols. This positions Hemi as a vital infrastructure layer for decentralized finance across Bitcoin and Ethereum, enabling innovation and scalability across the blockchain space. Through the protocols offered by Hemi's early Day One ecosystem collaborators, users will be able to: - build applications that are both Bitcoin- and Ethereum-aware; - participate in lending and DEX liquidity provision, or allocate funds into specialized vault products; - trade perpetuals; - stake and restake popular BTC and ETH tokens; - borrow, and swap tokens; and - create synthetic assets. In particular, Hemi's DeFi ecosystem has a strong focus on providing liquidity and yield opportunities for many of the most popular liquid staking tokens (LSTs) and liquid restaking tokens (LRTs) from the Bitcoin and Ethereum ecosystems. "Just over six months after introducing our incentivized testnet, Hemi has demonstrated its resilience and capability as a powerful network for advancing blockchain applications across Bitcoin and Ethereum," said Jeff Garzik, co-founder of Hemi. "The Hemi team has a clear and compelling vision for unlocking the programmability, portability, and potential of Web3," said Ted Breyer, partner at Breyer Capital. "With a distinguished track record, they are uniquely positioned to deliver." A Layer-2 from a Different Point of View Attempts to integrate and scale Bitcoin and Ethereum have tended to address the problem within their respective communities, resulting in a fractured ecosystem. Hemi instead approaches Bitcoin and Ethereum as components of a larger supernetwork. This surfaces the key capabilities of both networks and, in turn, enables a new class of previously unattainable blockchain applications. Hemi's benefits include: - Unifying Bitcoin and Ethereum "The Hemi Virtual Machine (hVM) integrates a full Bitcoin node within an Ethereum Virtual Machine (EVM), enabling developers to harness the power of both Bitcoin and Ethereum using familiar and proven development tools. - Bitcoin Programmability "Building with the Hemi Bitcoin Kit (hBK) provides developers direct access to highly granular views of Bitcoin's state, unlocking new applications that were previously impractical or impossible to execute in a truly trustless, secure, and efficient way. - Superfinality "Through its PoP consensus protocol, Hemi inherits Bitcoin's full security in a truly decentralized and permissionless manner, exceeding Bitcoin-level finality ("superfinality") in just a few hours. - Trustless Cross-Chain Portability "With Tunnels, Hemi offers a Bitcoin-secured method for moving assets between Bitcoin and Ethereum. - Asset Programmability "Hemi's additional asset-programmability features include on-chain routing, time-lock, and password-protect. Gasless transfer enables asset movement without requiring a web3 wallet. "The Hemi team can be described in one word: ambitious. Everything we learned during our testnet has been embedded into the mainnet release and we are excited for our users and developers to build and use applications across Bitcoin and Ethereum," said co-founder and CTO Max Sanchez. About Hemi Labs Hemi Labs is the creator of the Hemi Network ("Hemi"), a modular Layer-2 network for superior scaling, security, and interoperability, powered by Bitcoin and Ethereum. Instead of approaching Bitcoin and Ethereum as siloed ecosystems, Hemi views them as components of a single supernetwork, unlocking new levels of programmability, portability, and potential. Hemi Labs envisions a new, converged Internet ecosystem that is secure, interoperable, and ready for the many challenges of a Web3 that is imminently colliding with the Internet at large. BTC is currently trading steadily above \$90,000 and could soon regain the \$100,000 milestone. Its stronghold above this support level shows its resilience and potential to regain its all-time high. Amidst this, six altcoins are warming up for big moves. They are beginning to form bullish patterns, while some have shown strong momentum, pointing to a potential huge rally ahead. **Rexas Finance (RXS): The Future of Real-World Asset Tokenization** Rexas Finance is gaining traction, and experts believe it is gearing up for a major move post-launch. The presale has already laid a strong foundation for its growth, with the RXS token increasing by an impressive 566%. Investor enthusiasm has been high so far, leading to a remarkable presale that has raised over \$45.6 million and sold nearly 448 million tokens. With the official launch set for June 19 at \$0.25, analysts predict a massive rally, potentially leading to a 10,000% surge. What's drawing investors to Rexas Finance is its ambitious vision to transform asset viewing and handling. The platform is at the forefront of real-world asset (RWA) tokenization. It enables users to convert tangible assets like real estate and commodities into digital tokens, making high-value investments more accessible to everyday users. Rexas Finance achieves this by breaking RWAs into fractional shares. Thus, anyone, anywhere, can participate in markets that were once reserved for the wealthy. Rexas Finance's robust ecosystem further strengthens its appeal. The Rexas Token Builder simplifies asset tokenization for users without technical skills. Rexas GenAI harnesses AI to generate high-quality digital artworks, while Rexas Estate facilitates fractional real estate investments. These tools set Rexas apart as a leader in RWA tokenization. With Bitcoin stabilizing above \$90K, the market is primed for high-growth altcoins. Analysts predict RXS could surge to \$25 post-launch. Increased liquidity, strategic exchange listings, and growing interest in asset tokenization will drive this surge. As institutional investors and retail traders seek new opportunities, Rexas Finance is positioned as a top contender in the next crypto bull run. Its unique utility and ability to create new opportunities in the real-world assets market make it an attractive project poised to dominate decentralized finance. This factor ensures not only Rexas Finance's short-term growth but also its long-term growth potential. **Dogecoin (DOGE): A Potential Breakout from Oversold Levels** Dogecoin shows signs of a strong rebound after completing what analyst Asif.eth (@asifeth) believes is an ABC corrective pattern. He pointed out that Dogecoin's recent pullback has likely reached a key support zone between \$0.24 and \$0.18, which he considers a prime accumulation point. The RSI is also in oversold territory, which indicates selling exhaustion and can lead to a bounce back. While the bullish setup remains intact, the analyst warned that dropping below \$0.16 could invalidate the recovery. **TRON (TRX): Eyeing a Breakout After Months of Consolidation** Since its 94% surge in December, TRX has been stuck in a falling channel, with key support at \$0.20. Analysts suggest a potential breakout if TRX maintains this level. It could form a double-bottom pattern, signaling bullish momentum. Technical indicators like RSI and MACD hint at a reversal. Meanwhile, a strong social sentiment shows investors increasing interest in the project. If TRX breaks out, it could rally toward \$0.30, a 30% gain. However, if selling pressure increases, it might retest \$0.20 before any major move upward. **Binance Coin (BNB): Expanding Ecosystem Poised for Growth** As market sentiment builds, BNB is consolidating within the \$580-\$618 range. The BNB ecosystem continues to expand, with over 5,600 Dapps and \$3.6 billion in total value locked (TVL). This drives adoption across AI, decentralized science, gaming, and asset tokenization. Analysts predict a potential surge to \$2,000 soon. Rising institutional interest and high future open interest will drive this increase. If BNB breaks above \$590, increased volatility could push it toward its next resistance. Overcoming this can lead to further highs. **Ondo Finance (ONDO): Institutional Backing Fuels RWA Tokenization** Ondo Finance is causing excitement with its new Ondo Chain, a blockchain built for tokenizing real-world assets. Backed by major institutions like Franklin Templeton and Wellington Management, it's gaining traction in traditional finance. The ONDO token ranked 33rd with a \$4.3 billion market cap. This comes after increased attention following a \$470,000 investment from World Liberty Financial, a Trump-linked project. With growing institutional interest and Ethereum compatibility, Ondo Chain could play a key role in bridging traditional finance and blockchain. Thus, it's a token to watch. **Ripple (XRP): Strong Institutional Interest Could Trigger a Rally** XRP is gaining momentum as analysts predict a rally similar to its 2017 surge. The token recently saw a 2.5% price increase, sparking bullish sentiment. Veteran trader Peter Brandt also identified a flag pattern that could push XRP's market cap to \$500 billion within weeks. If this holds, XRP will take Ethereum's place on the chart. Institutional adoption, such as Bank of America integrating Ripple's technology, also drives optimism. Breaking past the key resistance level could send XRP soaring. Thus, it's a strong choice as Bitcoin stagnates. **Conclusion** These six altcoins look bullish and could be preparing for a massive rally as BTC shows strength above \$90,000. Meanwhile, Rexas Finance offers the most promise with its strong presale performance and unique proposition. These factors, including its upcoming token launch, create a promising future for the token. Once it launches in June, it could surge from \$0.25 to \$25. - Bitcoin drops over 7%, holding near \$89K. - BTC's daily trading volume has spiked by 197%. -

\$648.98M in BTC liquidations hit the market. The largest crypto asset, Bitcoin (BTC), has been navigating through a narrow bridge for the last few weeks. BTC has come up short in escaping the consolidation phase. BTC has been trading below \$100K since February 4, facing rejections despite multiple recovery attempts. Bitcoin's price has lost over 7.02%, crashed below \$90K, slipping through critical support ranges, extending its downturn amid President Donald Trump's anticipation of US tariffs on Mexico and Canada starting on March 4. The uncertainty over the impending tariffs led many investors to reduce exposure to risky bets, causing the cryptocurrency market to plunge by over 7.35% to \$2.88 trillion. The asset opened the day trading at \$96,087, and the emergence of bears took the price down to the \$86,873 range. At press time, Bitcoin traded at \$89,040. Consequently, BTC has stepped into the fear zone as the Fear and Greed Index rests at 25. During this timeframe, the market has witnessed a 24-hour liquidation of \$648.98 million worth of Bitcoin. Notably, the daily trading volume of the asset has reached \$75.04 billion. In addition, Ali's chart highlights that Bitcoin is breaking below a key parallel channel, signalling increased bearish pressure. If it fails to reclaim the \$92,500 level soon, the downward momentum could push prices toward \$81,000. Will BTC Bears Push Prices Lower? The market crash caused Bitcoin prices to enter bearish territory, and the selling pressure remains dominant. If sellers continue to take control, BTC could retest the \$87,257 support. Failing to cross over the level would put additional pressure, extending the correction of BTC. Assuming the market trend shifts and the buying pressure gains momentum, Bitcoin could move to the initial resistance at the \$88,460 range. In the case of a golden cross formation, BTC could climb to test higher, nullify the negative trend, and witness a resurgence in demand. The Moving Average Convergence Divergence (MACD) line and signal line of BTC are settled below the zero line. This indicates a strong bearish crossover with selling pressure outweighing buying interest. If this momentum holds, further declines could follow. Moreover, the Chaikin Money Flow (CMF) indicator positioned at -0.27 signals that the capital is flowing out of the asset. Sustained selling pressure strengthens the chance of an extended loss. Meanwhile, the daily trading volume of BTC has increased by over 197%. Bitcoin's Bull Bear Power (BBP) value of -9,163 points out a strong bear dominance, that sellers are in control and pushing prices lower. Besides, the daily relative strength index (RSI) found at 18.75 suggests extreme oversold conditions. This could point to a potential bounce.

- Metaplanet spent \$13 million (or around \$96,185) for 135 Bitcoin. - With its most recent acquisition, the Japanese company's BTC holdings now reach 2,225. Amid the recent crypto market crash "Bitcoin fell as much as 5% in a span of 10 hours" both Metaplanet and El Salvador piled on the Bitcoin. Metaplanet spent \$13 million (or around \$96,185) for 135 Bitcoin. While El Salvador, a country that stacks Bitcoin, bought 7 Bitcoin on February 24 (when the cryptocurrency was worth about \$94,050). These occurred just before Bitcoin's price dropped below \$91,000 in the early hours of February 25. Although crypto market sentiment has fallen to its lowest point in more than five months, Bitcoin has declined further and is now trading around \$89,663. With its most recent acquisition, the Japanese company's Bitcoin holdings now reach 2,225 Bitcoin. With a market value of more than \$205 million. Since announcing in April that it would accept Bitcoin as a treasury asset, the Simon Gerovich-led firm's investment in the cryptocurrency has increased by around 12.7%, with an average purchase price of \$81,834. But Metaplanet pointed out that their "BTC Yield" "the percentage change from one period to another in the ratio of a company's Bitcoin holdings to its diluted shares" is up 23.3% this quarter, putting them on pace to hit their Q1 aim of 35% each quarter. El Salvador Buys the Dip Data from BitBo's BitcoinTreasures.NET indicates that Metaplanet is the fourteenth biggest corporate Bitcoin holder globally as of right now. Meanwhile, the El Salvador National Bitcoin Office said that the country's Bitcoin purchases were six times more than its daily average of one Bitcoin. The transaction was made only one hour before Trump said that the United States would still impose a 25% tariff on imports from Canada and Mexico, and the cryptocurrency markets promptly declined after his confirmation. With its most recent acquisition, the Central American nation now owns 6,088 Bitcoin, which is valued at \$560.7 million. Highlighted Crypto News Today: Dogecoin (DOGE) Price Drops 10% Amid Rising Selling Pressure

Are you looking for the best cryptocurrencies to invest in? The cryptocurrency market is ranging, with Bitcoin hovering around the critical \$95,000 mark and Ethereum struggling to break past \$2,800. A 1.65% drop in total market cap, bringing it down to \$3.15 trillion, has been linked to significant security breaches. The recent Bybit hack led to a staggering \$1.4 billion loss in ETH. Despite Bybit CEO Ben Zhou confirming the full recovery of the stolen funds, the market remains under pressure, struggling to regain momentum. While identifying how to recover from this market turmoil, investors struggle to find the top crypto coins with massive gains. In this article, we have identified four promising crypto coins with high growth potential. Let's read more to discover these hidden gems and make the right investment decision. Top 4 Crypto Coins To Invest - Aureal One (DLUME) - DexBoss (DEBO) - yPredict (YPRED) - Polkadot (DOT) Each of these coins has unique features and high potential to thrive in this dynamic environment. These high-growth cryptos are equipped with robust technology and advanced tools to ensure strict security measures. Delve deeper into their deep insight and find out why Aureal One leads the list! 1. Aureal One (DLUME): A High-Potential Crypto Investment With the market continuously witnessing ups and downs, coins like Aureal One are set to surge high, possessing high stability and the potential to offer high ROI. Currently, in its presale, the platform is offering its token DLUME at a discounted price, which is at a faster rate surging high. It is one of the top crypto coins for 2025 to invest in, providing the opportunity to purchase tokens at a low cryptocurrency rate and reap the benefits. Click here to know more about Aureal One DLUME Financial Insights - USD Raised: \$3,260,472.8 / \$4,500,000 as of Feb 24, 2025 - Current Price: \$0.0013 - Next price increase: 15.4% - Listing Price: \$0.005 Aureal One Ecosystem & Features Aureal One is built on advanced blockchain technology tailored for the gaming and metaverse sectors. There are 1000 more games set to launch, which is supported by Zero-Knowledge Rollups (ZK-Rollups). Furthermore, it supports thousands of transactions per second (TPS), efficiently handling the demands of complex

gaming interactions. It is designed specifically for gaming applications, enabling rich, dynamic, and immersive environments within the metaverse.

2. DexBoss (DEBO)- Revolutionizing The DeFi Space DexBoss is a stable long-term growth project in the crypto market that aims to be the next big crypto coin. The adoption of the DEBO presale coin is growing rapidly as more investors learn about the potential of this project, with 78% of the presale raised completed. The platform offers a simplified transition between fiat and crypto, offering seamless on- and off-ramp solutions. With support from over 10 trusted partners, DexBos allows users to earn passive income through liquidity farming and staking.

DEBO Key Statistics - USD Raised: \$591,604.44 out of \$750,000 - Presale Progress: 79% - Current Price: \$0.011 - Listing Price: \$0.0505

DexBoss Ecosystem DexBoss offers automated risk management tools that operate 24/7, ensuring users stay protected while trading. With access to over 2,000 cryptocurrencies, DexBoss is a low risk crypto with high ROI, designed to increase users' profit while making sure the transaction and assets stay safe. It expands strategies with options, futures, and leveraged trading for maximum profit potential.

3. yPredict (YPRED): AI System For Traders To Navigate yPredict improves crypto trading by using artificial intelligence for better decision-making. Traders get predictive insights to identify trends and profitable opportunities. The technology processes vast market data, helping traders navigate crypto volatility with greater accuracy. This system supports users by providing real-time market assessments, ensuring more informed strategies to get the best crypto to invest in the ever-changing crypto environment.

YPRED Key Finance Insights - Token Sold: 80,000,000 - Raised: \$6,507,551 - Price: \$0.004546

yPredict Ecosystem It works as an AI-powered forecasting model for informed decision-making, emerging as the next big crypto coin. It provides predictive chart analysis to forecast future price trends with customizable technical analysis tools for precise market insights. It helps to detect candlestick formations and key market structures.

4. Polkadot (DOT): A Secure and Decentralized Blockchain Network Polkadot is more than just another best crypto to invest in. It helps to identify the decentralized protocol that fosters secure communication like Ethereum and Bitcoin. At the heart of this ambitious project lies the DOT token, which fuels the network's operations and governance.

DOT Key Financial Insights - Current Price: \$4.73 - Market Cap: \$7,356,062,899.85 - Circulating Supply: 1,551,866,581.46

DOT Polkadot Ecosystem Polkadot Chain has access to \$6 billion in economic security, and its landscape allows its users to enjoy unmatched security, scalability, and interoperability. It allows rapid tier 1 blockchains by executing transactions on the network and achieving shared finality with 6-second block timings. Easily transfer tokens within the Polkadot ecosystem and to external chains like Ethereum.

Final Words: Aureal One- The Best Crypto to Invest in Before The Next Price Increase With Bitcoin and Ethereum facing short-term challenges in maintaining their market momentum, investors are now exploring opportunities in the crypto space. These fluctuations have opened the door for emerging projects that offer innovative solutions and high-growth potential. Among them, Aureal One (DLUME) stands out with its focus on metaverse gaming, delivering high-speed transactions and low fees. Alongside Aureal One, other promising projects like DexBoss (DEBO), yPredict (YPRED), and Polkadot (DOT) are also capturing investor attention. These coins offer not only stability in an unpredictable market but also the potential for substantial gains. To stay ahead of the curve, investors are suggested to conduct thorough research for better prices among these top crypto coins.

Cryptocurrencies have solidified their role in the global financial landscape, spearheaded by Bitcoin (BTC) and XRP. Amidst these stalwarts, BlockDAG (BDAG) emerges as a formidable contender, shaking up the status quo with innovative technology and a groundbreaking approach to mining. XRP is targeting dominance in cross-border payments, and Bitcoin continues as the gold standard of digital assets. However, BlockDAG (BDAG) is carving out its niche with a decentralized mining model and a DAG-based structure, positioning itself as a cutting-edge buying option. So, which is the best long-term crypto to buy now? Let's examine their strengths and projected growth paths.

XRP: A Leading Payment Platform, But Facing Future Challenges XRP stands out as a swift, economical solution for international transactions, appealing mainly to banks and financial entities. Its rapid transaction capabilities, costing only fractions of a cent, set it apart from Bitcoin and Ethereum. XRP's broad adoption has propelled its market cap beyond \$130 billion, highlighting its pivotal role in the fintech arena. However, XRP is not without its challenges. It faces stiff competition from both traditional payment systems and new blockchain technologies. Moreover, ongoing regulatory scrutiny over Ripple continues to impact its market performance. While XRP's ecosystem is expanding, its future as the premier payment cryptocurrency remains uncertain.

Bitcoin: A Safe Bet on Scarcity & Mainstream Acceptance Often regarded as the most reliable long-term crypto investment, Bitcoin's appeal lies in its limited supply of 21 million coins and growing mainstream acceptance. The emergence of Bitcoin ETFs and its integration into the financial system have cemented its status as digital gold. Over the past five years, Bitcoin has yielded a remarkable 900% return, showcasing its resilience in bouncing back from market slumps. Nevertheless, concerns about Bitcoin's scalability, high transaction fees, and energy-intensive mining persist. Its proof-of-work mechanism favors large-scale mining operations, putting it out of reach for the average person. Here, BlockDAG introduces a revolutionary alternative.

BlockDAG (BDAG): Pioneering a Scalable & Inclusive Mining Future BlockDAG departs from Bitcoin's traditional blockchain with its directed acyclic graph (DAG) architecture, allowing simultaneous transaction validations and alleviating congestion issues. This leads to almost instantaneous transactions at lower costs. The game-changer for BlockDAG is its inclusive mining approach. The X1 Miner enables mining on mobile devices without the need for costly setups, democratizing the mining process and challenging the large-scale operations that dominate Bitcoin mining. BlockDAG's presale has successfully raised over \$197.5 million, with more than 18.5 billion BDAG tokens sold. Early adopters from the first batch have seen returns of 2,380%, with current

pricing at \$0.0248 in Batch 27. Projections suggest BDAG could reach \$1 by 2025, offering a potential return of 3,930%. The recent LISTING1000 bonus, providing a 350% additional BDAG with each purchase, adds a sense of urgency. A purchase of \$1,000 today could effectively become \$4,500 in BDAG practically overnight, making BlockDAG a standout choice for the best long-term crypto to buy in 2025. Which is the Best Long-Term Crypto to Buy? While XRP boasts robust utility and Bitcoin remains the preeminent value store, BlockDAG sets itself apart with its advanced technology, scalable DAG architecture, and user-friendly mining. With rapid transaction speeds, decentralized mining capabilities, and unprecedented presale success, BDAG offers the most promising growth potential for long-term buyers. For those eyeing crypto with significant growth prospects, BlockDAG represents itself as the best long-term crypto to buy now. However, with presale batches quickly selling out, acting swiftly is crucial to seize this exceptional opportunity. - Website: <https://blockdag.network> - Presale: <https://purchase.blockdag.network> - Telegram: <https://t.me/blockDAGnetworkOfficial> - Discord: <https://discord.gg/Q7BxghMVyu> Disclaimer: TheNewsCrypto does not endorse any content on this page. The crypto market is moving fast—like, blink and you miss it fast. Just take a look at Bitcoin Cash (BCH). It had its moment, soared high, and left many investors kicking themselves for not getting in sooner. The buzz around Bitcoin Cash had everyone thinking it was the next big thing, and for a while, it was. But now? The ship has sailed, and those who missed it are left wondering where to turn next. Enter Qubetics, the next-generation blockchain project that's making waves in the crypto space. Unlike Bitcoin Cash, which built on the Bitcoin name, Qubetics is forging a path of its own with real-world applications that solve issues other blockchains just couldn't. And the best part? It's still in its presale stage, meaning there's still time to get in before the rest of the market catches on. With over 487 million tokens sold and \$13.9 million raised so far, Qubetics is shaping up to be a massive player in the space. If you missed Bitcoin Cash, this might just be your second chance. Bitcoin Cash: The One That Got Away For a while, Bitcoin Cash had everyone hyped. It was supposed to be the faster, cheaper alternative to Bitcoin, and for a time, it delivered. Back in its early days, when BCH was trading for peanuts, those who got in saw jaw-dropping returns. The problem? Not everyone took the plunge, and before they knew it, the price had skyrocketed. Fast forward to today, and Bitcoin Cash is still hanging around, but it's no longer the explosive growth machine it once was. Sure, it has its loyal followers, but the days of easy 100x gains are long gone. If you were one of those investors who sat on the sidelines, hoping for another dip that never came, you know exactly what that regret feels like. The truth is, crypto moves fast. Those who hesitate often miss out. And while Bitcoin Cash may no longer be the golden ticket it once was, there's another altcoin presale right now that's turning heads for all the right reasons—Qubetics. Qubetics: The Top Altcoin Presale You Can Still Catch Qubetics isn't just another crypto project—it's a full-fledged blockchain ecosystem designed to fix real-world problems. With its Real World Asset Tokenization Marketplace, Qubetics is making it easier than ever to bring traditional assets like real estate, art, and intellectual property onto the blockchain. This isn't just another DeFi project; it's a platform that's bridging the gap between traditional finance and the digital future. Imagine a world where businesses, professionals, and everyday investors can tokenize their assets and trade them seamlessly on the blockchain. That's exactly what Qubetics is building. Whether it's a real estate developer tokenizing properties for fractional ownership or an artist securing royalties through blockchain-based smart contracts, Qubetics is making it all possible. And the numbers don't lie. The Qubetics best crypto presale is in its 23rd stage, with over 487 million tokens sold to 21,000+ holders, raising more than \$13.9 million. The current price? Just \$0.0888 per token. But with analysts predicting a 181.52% ROI at the presale's end and a potential 16,791% ROI after the mainnet launch, this is one of those rare moments where early investors can still get in before the real explosion happens. The Real-World Applications of Qubetics's Asset Tokenization Marketplace Picture a small business owner trying to raise capital. Traditionally, they'd need a bank loan or venture funding, both of which come with high barriers and loads of paperwork. But with Qubetics, they can tokenize their business assets, sell fractional ownership, and raise money from a global pool of investors—all without jumping through bureaucratic hoops. Or take real estate. Instead of needing hundreds of thousands of dollars to invest in a property, imagine being able to buy fractional shares in high-value real estate projects with just a few clicks. Qubetics makes that possible, opening up investment opportunities to everyday people, not just the ultra-wealthy. Artists, too, can benefit. Right now, musicians and digital creators struggle with fair compensation and copyright protection. Qubetics's blockchain-powered smart contracts ensure that every time their work is sold or used, they get paid instantly—no middlemen taking a cut, no shady business dealings. The use cases are endless. And that's why this isn't just another hyped-up presale—it's the kind of project that could redefine how we think about ownership and finance in the digital age. Conclusion: Don't Make the Same Mistake Twice If you missed out on Bitcoin Cash when it was cheap, don't let history repeat itself. The Qubetics presale is still open, but it won't stay that way for long. With every stage, the price goes up, and the window of opportunity gets smaller. This is your second chance to catch a top altcoin presale before it takes off. With real-world applications, top-tier partnerships, and massive growth potential, Qubetics is the kind of project that doesn't come around often. So if you're looking for the next big thing in crypto, now's the time to take action. For More Information: - Qubetics: <https://qubetics.com> - Telegram: <https://t.me/qubetics> - Twitter: <https://x.com/qubetics> 1. Why was Bitcoin Cash a missed opportunity? Bitcoin Cash had a huge run early on, offering massive gains to early investors. But now, its growth has slowed, making it a less attractive option for those looking for high returns. 2. What makes Qubetics a top altcoin presale? Qubetics offers real-world solutions through its asset tokenization marketplace, allowing businesses, professionals, and individuals to tokenize and trade assets securely on the blockchain. 3. How much

has Qubetics raised so far? Qubetics has raised over \$13.5 million, selling more than 483 million tokens to over 20,800 holders in its 23rd presale stage. 4. What are analysts predicting for \$TICS? Analysts predict \$TICS could hit \$0.25 by the presale's end, with potential growth to \$10-\$15 after the mainnet launch, offering massive ROI opportunities. 5. How can I buy Qubetics tokens? Anyone can purchase \$TICS tokens at \$0.0888 in the 23rd stage of the presale through the official Qubetics website. Disclaimer: TheNewsCrypto does not endorse any content on this page. - The bulk, about 56%, is probably associated with arbitrage strategies as per 10x Research. - This indicates that there is much less of a need for Bitcoin in multi-asset portfolios for the long run. Among Bitcoin exchange-traded funds, arbitrage methods have been the norm, with just 44% of inflows being linked to long-term investments, according to a crypto research firm, 10x Research. Since their introduction in January 2024, spot Bitcoin ETFs in the US have seen net inflows of around \$39 billion. But according to 10x Research's director of research Markus Thielen, only \$17.5 billion "less than half" represents genuine long-only purchasing. Arbitrage Opportunities The bulk, about 56%, is probably associated with arbitrage strategies, he said. Further mentioning the "carry trade" in which traders purchase spot Bitcoin via ETFs. While simultaneously shorting Bitcoin futures in order to profit from the spread between the two prices. According to Thielen, this indicates that there is much less of a need for Bitcoin in multi-asset portfolios for the long run than what the media would have you believe. Thielen elaborated by saying that trading companies and hedge funds that focus on taking advantage of yield gaps and market inefficiencies. Rather than assuming direct direction risk are the biggest investors of BlackRock's IBIT ETF. The arbitrage opportunities that were available a few months ago are no longer available, and hedge funds and trading firms are actively selling out their Bitcoin ETF holdings because funding rates and basis spreads are too low to justify new positions. According to Farside Investors, \$552 billion left the products over the course of four trading days last week. At the same time, Bitcoin's price remained range-bound throughout the week. Media coverage of these withdrawals as negative signals is hurting market sentiment, according to Thielen. However, unwinding is essentially market-neutral since it entails selling exchange-traded funds (ETFs) while purchasing Bitcoin futures, which effectively offsets any directional market impact. - Now, the business's Bitcoin holdings have increased to 9 BTC. - The rising profile of cryptocurrencies in business was one factor that prompted HK Asia's board to buy Bitcoin initially. Just one week after purchasing its first Bitcoin, investment company HK Asia Holdings Limited saw a doubling of its share price. Now, the business's Bitcoin holdings have increased to 9 BTC. Hong-kong-based HK Asia said on February 23 that its board has authorized the firm to further increase its investment in Bitcoin and revealed that on February 20, it had bought around 7.88 Bitcoin for a total of about \$761,705 dollars. Banking on Bitcoin Additionally, it said that its most recent acquisition of Bitcoin was funded internally. This purchase increased its overall Bitcoin holdings to around 8.88 BTC, with an average purchase price of \$97,021 per coin, or approximately \$861,500 in total. When markets reopened on February 17, investors flocked to HK Asia's shares after the company announced on February 16 that it had bought 1 bitcoin. By the end of trading on February 17, the stock price had risen by about 93%. By the time the lunch hour rolled around on February 24th, shares in HK Asia had climbed 5.7% on the Hong Kong Stock Exchange, with Google Finance showing the price at around 6.66 Hong Kong dollars, or 86 cents. The share price of HK Asia has increased 1,700% so far this year. The company previously had its all-time high of 6.50 Hong Kong dollars (84 cents), established in June 2019. Buying Bitcoin has been a popular strategy for publicly listed companies looking to increase profits, and HK Asia is no exception. The rising profile of cryptocurrencies in business was one factor that prompted HK Asia's board to buy Bitcoin initially, according to a statement made earlier this month. At the time of writing, Bitcoin is trading at \$95,780 as per data from CMC. The price has witnessed brief decline amid the ongoing tariff imposed by the US on countries. Highlighted Crypto News Today: WazirX Discreetly Moves Funds Out of Bybit After the \$1.5B Hack

- US state Georgia introduced a second Bitcoin reserve bill. - The bill aims to allow the state treasurer to invest in Bitcoin without restrictions. The number of US states that are exploring Bitcoin investments has lost count under Trump's presidency. Georgia has also filed a Bitcoin reserve bill on Feb 14, 2024 adding to the list of these states. As per the latest updates, Georgia filed for a second Bitcoin reserve bill to invest in Bitcoin without any limitations. ðŸ’Œ NEW: Georgia introduces its second Bitcoin Reserve bill (SB 228) to allow the state to invest in Bitcoin without any investment limit. pic.twitter.com/4Zjnmj3UiRa â€” Cointelegraph (@Cointelegraph) February 24, 2025 Georgia filed an SA228 bill to allow the state treasurer to invest in the original cryptocurrency Bitcoin. The state treasurer also aims to introduce further policies to accept, store, and make Bitcoin transactions. It is also planning to revoke all the conflicting laws regarding Bitcoin investments in the state. Georgia Senator Introduced SB 178 to Invest in Bitcoin Earlier this month, Georgia State Senator Greg Dolezal introduced a bill SB 178 to permit the state treasury to invest in Bitcoin. It will add Bitcoin to the state's investment portfolio once the bill is passed. Before this bill was passed through the legislation, the state introduced the present second Bitcoin reserve bill. An increasing number of US states are proposing bills to add Bitcoin to their treasuries. After Trump won the US elections and promised to make the country the crypto capital of the world, the industry is witnessing increasing regulatory policies in the country. As per the latest updates, the Montana committee passed the strategic Bitcoin reserve bill under the leadership of C-Schomer. It is only a matter of time before we see almost all the US states establishing strategic

Bitcoin reserves. On the other hand, the diminishing value of fiat currencies is also further pushing the adoption of Bitcoin. Highlighted Crypto News Today:

- The US State of Montana saw its House of Representatives reject the idea of a Bitcoin Reserve bill. - Several other state governments have ventured into crypto with passing bills on digital assets' investments. The crypto market has furthered downwards over the weekend. Bitcoin has once again docked its ship at \$95,000 after progressing closer to \$100K just a few days ago. These bearish winds have also swayed the AltSeason's sails causing minor price drops. On the other hand, the past day has seen a surge in activity following the weekend slump. Leading cryptocurrency nation, the USA received news of one of its states rejecting a Bitcoin Reserve Bill amidst optimistic regulations. The State of Montana saw its House Representatives vote against making Bitcoin a state reserve asset. The bill, similar to other states, aimed to include Bitcoin, digital assets, and stablecoins in the states' reserve assets. One Representative stated that taxpayers' money needs to be protected and that such investments "are way too risky." The community has not reacted too negatively; one member even discussed how they hoped that the state of Montana might reform its attitude in the future. Meanwhile, the bill's sponsor Curtis Schomer stated "The only thing that is risky is not passing this bill." He discussed how if the State continued to invest in bonds, it might lose purchasing power for these assets. How Is the US States' Bitcoin Reserve Bill Landscape Shaping Up? In January 2025, the US states announced that they plan to introduce up to 20 Strategic Bitcoin reserves in the nation. Multiple states including Ohio, Texas, and Illinois have passed bills regarding the same. This surge in states' interest in Bitcoin and digital assets investments further aided in advancing the US's pro-crypto stance. Although these shifts have not affected the price explicitly in the past month, it has resulted in a major transformation within the regulatory sector. Zooming out internationally, Russia and a specific South African firm AltVest Capital also have adopted the Bitcoin Strategic Reserve concept. Highlighted Crypto News Today: Sonic (S) Falls 10% After a Strong Rally As Bullish Momentum Fades

- Bitcoin (BTC) is currently trading at \$95,895, down 0.93% in 24 hours. - U.S. states like South Dakota and Utah show increasing Bitcoin adoption. Bitcoin (BTC) is currently trading at \$95,895.79, marking a 0.93% decline over the last 24 hours. The cryptocurrency hit a low of \$95,685.71, with a 24-hour trading volume of \$15.68 billion, reflecting a 65.45% decrease. The market cap remains at \$1.9 trillion. South Dakota and Utah are advancing plans to integrate Bitcoin into their state reserves. This reflects a growing trend of U.S. states adopting cryptocurrency as part of their financial strategies. Institutional investors are also focusing on Bitcoin, with anticipation of the upcoming halving event. BlackRock's Bitcoin ETF continues to dominate inflows, reinforcing BTC's long-term bullish outlook. Will BTC Overcome Key Resistance? Bitcoin's Relative Strength Index (RSI) stands at 42.07, below the neutral 50 mark, signalling a bearish sentiment. The RSI moving average is at 48.42, reinforcing the downward momentum. If the RSI moves below 40, Bitcoin could enter oversold territory, which might trigger a price rebound. The Chaikin Money Flow (CMF) indicator is at -0.13, suggesting more capital outflows than inflows. This indicates weakening buying pressure, increasing the risk of further downside. A move into positive territory would suggest renewed accumulation by investors. The 50-day moving average (MA) is trending above the current price, indicating that BTC is struggling to regain momentum. The 200-day MA remains strong, serving as long-term support. If Bitcoin can reclaim its short-term moving average, it could signal a potential reversal. A bearish moving average crossover is forming, where shorter-term MAs are dipping below longer-term MAs. This suggests that Bitcoin may experience further price corrections before attempting a rally. Bitcoin faces immediate resistance at \$97,000. If BTC surpasses this level, it could test \$100,000, driven by increased buying activity. On the downside, BTC has strong support at \$95,000. A break below this could push the price toward \$93,000, with further losses likely if selling pressure increases. Bitcoin remains under pressure, with technical indicators pointing to potential downside risks. However, long-term fundamentals, including state-level adoption and ETF inflows, continue to support the market. BTC must break \$97,000 to regain bullish momentum. Highlighted Crypto News Today Is MKR's Golden Cross a Precursor to a Larger Breakout?

Cryptocurrency has taken the world by storm, shaking up traditional finance and creating life-changing investment opportunities. From the OG Bitcoin to cutting-edge blockchain startups, digital assets have become a powerful alternative to stocks and real estate. And let's be real "everyone's hunting for the next big thing in crypto. Qubetics has emerged as a significant force within the industry, offering innovative solutions that set it apart. With its groundbreaking Web3 aggregator and the highly accessible QubeCode IDE, this project extends beyond being merely another token; it represents a comprehensive ecosystem designed to cater to businesses, professionals, and individuals new to blockchain technology. By integrating advanced tools and user-friendly functionalities, Qubetics is poised to drive widespread adoption and streamline blockchain development for a diverse audience. But Qubetics isn't the only crypto giant making headlines. Tron and Bitcoin Cash are both well-established players that have stood the test of time. Each offers unique investment advantages, making them worthy contenders in the battle of top altcoins. Let's break down what makes these three projects stand out and why they continue to attract investors. Qubetics: The Future of Blockchain Development Qubetics, the world's first Web3 aggregator, is making waves with its mission to democratize blockchain technology. At the heart of this mission is the QubeCode Integrated Development Environment (IDE), a user-friendly platform that enables anyone "from tech novices to seasoned developers" to create smart contracts and decentralized applications (dApps) without extensive coding knowledge. Imagine you're a small business owner in São Paulo, Brazil. You've heard about the benefits of blockchain "enhanced security, transparency, and efficiency" but the technical barriers seem insurmountable. With QubeCode IDE, you can drag and drop components to build a custom supply chain management system on the blockchain, streamlining your operations and gaining a competitive

edge. The Qubetics presale is currently in its 22nd stage, with each \$TICS token priced at \$0.08073. The project has already raised over \$13.6 million, attracting more than 20,900 token holders and selling over 484 million \$TICS tokens. Analysts are optimistic, predicting that \$TICS could reach \$0.25 by the end of the presale, translating to a 209.67% return on investment (ROI). Looking further ahead, projections suggest that \$TICS could soar to \$1 post-presale (1,138.69% ROI), \$5 (6,093.48% ROI), \$6 (7,332.18% ROI), and even \$10 after the mainnet launch, offering a staggering 12,286.96% ROI. Beyond the financials, Qubetics is known in the crypto community for its commitment to accessibility and innovation. The QubeCode IDE is a testament to this, offering real-life applications that make blockchain integration seamless. For instance, a freelance graphic designer in Buenos Aires can use QubeCode to create and sell non-fungible tokens (NFTs) of their artwork, reaching a global audience without intermediaries. Similarly, a tech startup in Mexico City can develop a decentralized finance (DeFi) platform to offer microloans to local entrepreneurs, fostering economic growth in their community. With a strong roadmap, a real-world use case, and a massive presale success, Qubetics is one of the best crypto ICOs to invest in right now.

Tron: The OG of Decentralized Content Tron (\$TRX) has been a major player in the crypto world since 2017, spearheaded by the ever-controversial Justin Sun. Its goal? To decentralize content creation and cut out middlemen like YouTube and Spotify. Over the years, it has expanded its ecosystem to include DeFi applications, NFT marketplaces, and high-speed smart contracts. Tron stands out due to its ultra-low fees, making transactions nearly cost-free compared to Ethereum's often expensive gas fees. Its high scalability allows the network to process thousands of transactions per second, ensuring speed and efficiency for users. Additionally, Tron has experienced a significant boom in the NFT and DeFi space, with its ecosystem expanding rapidly through a growing number of decentralized applications. This combination of low costs, high transaction capacity, and a thriving ecosystem makes Tron a unique and competitive blockchain platform. Right now, TRX is trading at around \$0.24, solid, considering its resilience through multiple bear markets. Investors see Tron as a long-term play, especially as it continues to integrate NFTs, gaming, and DeFi projects into its blockchain.

Bitcoin Cash: The True Peer-to-Peer Digital Cash Bitcoin Cash (\$BCH) was born in 2017 as a fork of Bitcoin. While BTC is often seen as "digital gold," BCH remains true to Satoshi Nakamoto's original vision of fast, low-cost transactions. Bitcoin Cash remains a strong contender in the crypto space due to its larger block size of 32MB, which enables faster transactions compared to Bitcoin's 1MB blocks. Its super low fees make it ideal for everyday transactions, as a \$1,000 transfer can cost just a few cents. Additionally, widespread merchant adoption keeps Bitcoin Cash relevant, with many businesses around the world accepting it as a payment method. This combination of speed, affordability, and usability ensures that BCH continues to hold its ground in the competitive cryptocurrency market. Right now, BCH is priced at approximately \$321, making it a more affordable alternative to Bitcoin while still offering real-world utility.

Conclusion: Which Crypto Is the Best Investment? If you're hunting for the best crypto ICOs to invest in, Qubetics is the clear standout. With its Web3 aggregator, game-changing QubeCode IDE, and a massively successful presale, the potential returns are undeniable. The numbers don't lie—analysts predict that early investors could see life-changing profits once the mainnet goes live. Meanwhile, Tron and Bitcoin Cash remain solid investments. Tron continues to dominate the decentralized content space, while Bitcoin Cash offers a fast and efficient alternative to Bitcoin for payments and transactions. So, what's the move? If you're looking for a high-growth, high-reward opportunity, Qubetics is the hottest ticket in town with the best crypto presale. Don't sleep on it—crypto's next big thing is already here. FAQs

1. Is Qubetics a good investment? Absolutely. With a strong use case, a booming presale, and analyst predictions pointing to explosive growth, Qubetics is one of the best crypto ICOs to invest in right now.
2. How does QubeCode IDE work? QubeCode IDE allows users to build smart contracts and dApps without needing coding skills. It's perfect for businesses, professionals, and individuals looking to integrate blockchain tech easily.
3. Can Tron (\$TRX) and Bitcoin Cash (\$BCH) still compete with new cryptos? Yes. Tron remains a powerhouse in decentralized content, and Bitcoin Cash is still one of the best options for fast, low-cost transactions. Both have strong communities and real-world utility, keeping them relevant in the crypto space.

While Bitcoin (BTC) and Ethereum (ETH) managed to regain some ground, savvy investors understand that their massive market caps severely limit their upside potential, making them more viable as stores of value rather than investment vehicles. For this reason, projects with untapped potential, like Lunex Network (LNEX), emerge as attractive alternatives for market participants looking to secure asymmetrical ROI. Lunex Network in particular stands out with its unique cross-chain protocol that could soon become a dominant force in the DEX landscape while minting the next generation of crypto millionaires. Could Bitcoin Reclaim \$100,000 Soon? Yesterday Bitcoin saw a flash correction and tapped the \$93,000 support zone, but as buyers stepped in the BTC price rebounded by 2.5%, reentering the trading channel around \$96k. Despite this slight Bitcoin recovery, uncertainty is still prevalent as geopolitical tensions are ramping up, along with the lingering fears of a full-blown trade war between the US and China. To make matters worse, stablecoin supply has stagnated, with a minimal 0.37% increase in the past month, contrasting with the significant inflows observed in late 2024. On a more bullish note, institutional players keep bidding. Tokyo-based investment firm Metaplanet has increased its Bitcoin holdings to 2,031 Bitcoin after purchasing an additional 270 BTC for approximately \$25.8 million. The company plans to hold 10,000 BTC by the end of 2025 and 21,000 BTC by 2026, reinforcing its commitment to Bitcoin despite market volatility.

Ethereum Rebounds, But Gains Are Modest Ethereum also rebounded by roughly 3.3% on the daily timeframe and is currently selling for \$2,700. However, a decisive reclaim of the \$2,800 resistance continues to elude investors as this is where selling pressure intensifies and pushes the price downward. Ethereum ETFs have recorded a substantial \$354 million in net outflows since the start of February as market participants are trying to mitigate risk in light of Ethereum's indecisiveness and the increasingly ambiguous financial climate. On the other hand, Ethereum is seeing rising open interest which is up 2.5% in the last 24 hours, and over 300,000

ETH has been withdrawn from exchanges indicating long-term bullish sentiment among spot and derivatives traders. For Ethereum to regain strong momentum, buying pressure needs to ramp up, and the \$2,800 level must be flipped into support. Once this happens, a reclaim of the \$3,000 resistance should come shortly after. How Lunex Network Redefines DeFi Lunex Network solves all of the inefficiencies that have hindered DeFi adoption, namely poor liquidity, high fees, and sub-optimal interoperability between blockchains. Lunex Network's cutting-edge cross-chain protocol seamlessly integrates over 50,000 different assets and supports all major blockchains, including Tron, Ethereum, and Bitcoin. Users will be able to perform near-instant swaps at the lowest possible fees, while slippage is also minimized as Lunex Network sources liquidity from the various blockchains. Moreover, users will also enjoy complete privacy as Lunex Network requires no KYC verification, removing any possibility of data leaks. No third-party wallet is required either, to perform a transaction, users just need to select the pair, provide a receiving address, and confirm. One of Lunex Network's star features is the revenue-sharing mechanism powered by the native \$LNEX token. Users will enjoy up to 18% APY in the form of staking rewards. To sustain this, Lunex will perform open market buybacks of \$LNEX by reinvesting a portion of its weekly earnings. So far more than \$7.2 million has been raised in the ongoing presale of the \$LNEX token, which is now priced at \$0.007. With an incredible array of features that wait to be explored and its revolutionary reward system, Lunex Network could soon become a staple in any future-proof portfolio. The best time to get involved? Today! You can find more information about Lunex Network (LNEX) here: - Website: <https://lunexnetwork.com> - Socials: <https://linktr.ee/lunexnetwork> Disclaimer: TheNewsCrypto does not endorse any content on this page. Cryptocurrency has taken the world by storm, offering new avenues for financial freedom, cross-border transactions, and investment growth. With so many projects vying for attention, it's hard to know which ones are worth your time and money. As the market evolves, one burning question remains: which will be the next crypto to hit \$1? Three major players standing out in the crowd today are Qubetics, Sonic, and Bitcoin Cash. While Bitcoin Cash has long been recognized as one of the top contenders in the crypto world, Sonic and Qubetics bring exciting new features that could potentially set them apart. But which one will be the next crypto to hit \$1? Let's dive deep into these three to figure it out. In this article, we'll break down each of these projects individually and take a close look at their features, potential for growth, and why they could be the next big thing. Whether you're an investor eyeing the next big opportunity or a crypto enthusiast eager to learn more about what's coming next in digital finance, this article will provide all the insights you need. From Qubetics' innovative approach to cross-border transactions to Sonic's community-driven features and Bitcoin Cash's stability, there's a lot to unpack. Let's start by exploring Qubetics and how its vision is reshaping the landscape of blockchain and digital finance. With its ongoing presale now in its 22nd stage, Qubetics is already generating significant buzz and showing massive potential as the next crypto to hit \$1. Qubetics: The Future of Cross-Border Transactions If you're asking, "Is Qubetics the next crypto to hit \$1?" you're not alone. As of today, Qubetics is in the middle of its 22nd crypto presale stage, and it has already sold over 484 million tokens to more than 20,900 holders, raising over \$13.6 million. The price of \$TICS tokens sits at \$0.0807, but analysts predict that by the end of the presale, it will be priced at \$0.25—an impressive 209.67% ROI. More thrillingly, predictions indicate that after the presale ends, the token could soar to \$1, providing a whopping 1138% ROI. What makes Qubetics stand out from other coins is its focus on solving real-life problems that existing blockchain projects haven't fully addressed, particularly when it comes to cross-border transactions. Today's global economy requires systems that can handle seamless, fast, and affordable transactions across borders, and that's where Qubetics comes in. By creating a decentralized and transparent network, Qubetics aims to lower the barriers that typically make international transactions complex and costly. Its unique solution makes it easier for businesses, professionals, and individuals to carry out transactions without worrying about fees, delays, or complicated intermediaries. Qubetics utilizes a hybrid model that combines cutting-edge blockchain technology with traditional finance systems, offering users the best of both worlds. It's clear that Qubetics has the potential to revolutionize cross-border transactions, positioning itself as a major player in the future of digital finance. So, could it be the next crypto to hit \$1? Only time will tell, but the signs are promising. Sonic: A Community-Driven Coin with Big Ambitions Next, let's take a look at Sonic, another coin that's been making waves in the crypto space. Sonic is unique because it is a community-driven coin, designed to prioritize the needs and wishes of its user base. While it doesn't have the same cross-border transaction focus as Qubetics, Sonic shines with its deep community engagement and commitment to transparency. The team behind Sonic believes in the power of decentralized governance and aims to give users more control over the direction of the project. One of the biggest strengths of Sonic is its active community. Sonic has managed to build a loyal and passionate following, making it one of the few projects where community involvement directly influences the roadmap. Whether it's through governance proposals or collaborative events, Sonic allows its users to have a say in how the project evolves. This kind of interaction makes Sonic stand out, as it fosters an ecosystem where users feel valued and heard. Sonic also features several utility aspects, including a decentralized exchange (DEX) and various partnerships with gaming projects, which provide additional value to holders. However, when it comes to the potential to hit \$1, Sonic has a long way to go, especially in comparison to established coins like Bitcoin Cash and the promising up-and-comer Qubetics. That said, its community-driven model could result in faster adoption as more users jump on board, which could fuel its growth. Bitcoin Cash: Stability in the Crypto World Let's talk about Bitcoin Cash (BCH), a coin that has been around since 2017 and remains one of the most widely recognized cryptocurrencies. Born out of a hard fork from Bitcoin, BCH was designed to provide a solution to the scalability issues that plagued Bitcoin at the time. With lower transaction fees and

faster confirmation times, Bitcoin Cash has positioned itself as an alternative to Bitcoin, especially for those looking for a faster and cheaper way to conduct peer-to-peer transactions. While Bitcoin Cash has been relatively stable in comparison to the rollercoaster ride that is typical in the cryptocurrency market, its market value has fluctuated over time. BCH has a large market cap and a solid user base, which makes it a trusted asset in the crypto community. However, despite its longevity, it hasn't had the same explosive growth potential as some of the newer projects like Qubetics. That being said, Bitcoin Cash's real strength lies in its established infrastructure and its ability to provide reliable and inexpensive transactions. If you're looking for a tried-and-true coin that offers stability, BCH could be your go-to. But as far as being the next crypto to hit \$1? That's something that might take a bit longer for BCH, considering its current price range and the competition from newer projects like Qubetics.

Cross-Border Transactions: A Game-Changer for the Future

When it comes to the future of blockchain and cryptocurrency, cross-border transactions will be a major focal point. This is especially important for businesses, professionals, and individuals who frequently need to send money internationally. Traditional systems like banks often charge high fees and take several days to process transactions. In contrast, blockchain technology can provide a much faster and cheaper alternative. Qubetics, in particular, is focused on solving this issue. By simplifying and reducing the cost of international payments, Qubetics aims to unlock opportunities for global commerce, helping small and medium-sized enterprises (SMEs) expand their reach without worrying about expensive transaction fees. This could be the key to mass adoption in countries with underdeveloped financial systems or in regions where financial services are inaccessible. The potential impact of easier cross-border transactions cannot be overstated. With the right technology, blockchain could redefine how the world does business, and Qubetics is at the forefront of this revolution.

Conclusion

As we wrap things up, one thing is clear: there's no shortage of innovation in the cryptocurrency world. Qubetics, Sonic, and Bitcoin Cash each bring something unique to the table, and each has the potential to make significant strides in the market. But when it comes to the next crypto to hit \$1, Qubetics seems to be the most promising contender due to its revolutionary approach to cross-border transactions, its presale success, and the growing interest from the community. If you're looking to get in early on a project that could reshape the future of digital finance, Qubetics might just be the opportunity you've been waiting for. Be sure to keep an eye on this one as it evolves! For More Information: Qubetics: <https://qubetics.com> Telegram: <https://t.me/qubetics> Twitter: <https://x.com/qubetics>

FAQs

What makes Qubetics stand out from other cryptocurrencies? Qubetics focuses on solving real-life problems like expensive and slow cross-border transactions, making it an ideal choice for businesses and individuals alike. Is Sonic a good investment? Sonic's community-driven approach and solid utility aspects make it an interesting project, but its growth potential may not be as strong as Qubetics or Bitcoin Cash. Can Bitcoin Cash hit \$1 again? Bitcoin Cash is more stable but has already reached its peak. While it may see gradual growth, it's unlikely to be the next crypto to hit \$1. How does Qubetics improve cross-border transactions? Qubetics simplifies international payments by reducing fees and speeding up transactions, which is a game-changer for businesses worldwide. Why should I invest in Qubetics? With a rapidly growing presale and a focus on solving crucial issues in the finance world, Qubetics has massive potential for long-term growth.

- South African AltVest Capital plans to add Bitcoin to its treasury reserve. - AltVest Capital plans to raise \$10 million to buy more Bitcoin. Despite trading below its ATH and previous highs, Bitcoin's reputation as a reserve asset didn't go away. While multiple US states started exploring Bitcoin strategic reserves this month, it is now an African firm's turn to adopt BTC. South Africa-based AltVest Capital is exploring the adoption of Bitcoin as a treasury reserve asset. As per the recent report published by reputed news media Bloomberg, AltVest Capital is following the footsteps of Strategy. It plans to be the first company in Africa to add Bitcoin to its financial reserve. So far, the company purchased one Bitcoin and applied to regulators to get the permission to raise funds to buy more Bitcoin. AltVest Capital Following Footsteps of Strategy, MARA, and Metaplanet The report further says, AltVest Capital applied for permission to raise 200 million rand, approximately \$10 million, to purchase Bitcoin. Following the likes of renowned global firms such as Strategy, MARA, and Metaplanet, AltVest Capital also plans to raise these funds to stack up BTC. While Strategy and MARA raised funds by offering 0% convertible notes, AltVest plans to do so by selling its stocks. No matter the process of fundraising, the end goal is to acquire the original digital currency, Bitcoin. However, no further details regarding the fundraising activities were disclosed. CEO of AltVest Capital Warren Wheatley stated, "Bitcoin serves as a strategic reserve asset to diversify our financial portfolio and acts as a hedge against economic instability and currency devaluation. It particularly aims to defend against the weakness of the South African Rand (ZAR)." As the fiat currency tumbles and fails to maintain global countries' and firm's economic health, Bitcoin will soon emerge to be a global reserve asset within no time. Highlighted Crypto News Today:

- Ross Ulbricht urges support for Roger Ver, citing his past advocacy. - Ver was arrested in Spain and faces extradition to the U.S. on tax fraud charges. Ross Ulbricht, the recently pardoned founder of Silk Road, is now advocating for clemency for Roger Ver, also known as "Bitcoin Jesus." Ver was arrested in Spain in April 2024 on U.S. charges of tax evasion, fraud, and filing false tax returns. He faces a potential 109-year prison sentence if convicted. In a statement on X on February 20, Ulbricht called for Ver's release. He expressed gratitude for Ver's support during his imprisonment and urged the crypto community to rally behind him. "Roger Ver was there for me when I was down and needed help. Now Roger needs our support," Ulbricht wrote. Roger Ver's Clemency Fight The U.S. Department of Justice alleges that Ver failed to report capital gains from Bitcoin sales and undervalued two companies when renouncing his U.S. citizenship in 2014. Prosecutors claim he concealed the sale of 131,000 Bitcoin worth \$240 million in 2017, leading to a \$48 million tax shortfall. Ver denies the charges, arguing that Bitcoin lacked liquidity at the time, making it difficult to file an

accurate exit tax. Ver attempted to dismiss the case in December 2023, calling U.S. exit tax laws unconstitutional. His lawyers claim the prosecution is politically motivated due to his libertarian and crypto advocacy. In a video on January 26, Ver directly appealed to former President Donald Trump, saying, "Only Trump's commitment to justice can save me." Trump fulfilled a campaign promise by pardoning Ulbricht, who served 12 years of a 40-year plus double life sentence for founding the Silk Road. He initially vowed to release Ulbricht on his first day in office but granted clemency on January 21, 2025. Supporters have launched a "Free Roger" campaign, mirroring Ulbricht's past efforts for clemency. Polymarket currently gives Ver a 10% chance of receiving a pardon from Trump. Edward Snowden and Julian Assange have slightly higher odds, while former FTX CEO Sam Bankman-Fried is at 2%. Highlighted Crypto News Today Vitalik Buterin Backs Argentina's Crypto Growth Amid LIBRA Token Collapse

- Bitcoin has factored in a modest price increase of 1.15% in the last 24 hours. - The cryptocurrency's daily trading volume showed a 5.68% increase as per CMC data. This time, an approaching weekend has triggered a bull market in the digital assets sector. Bitcoin broke its \$98K resistance in the late Asian evening hours of February 20. A frenzy went up in the market as community members began celebrating the arrival of the Alt Season. Leading analysts have stated that the Alt Season this term might be unique. Meanwhile, reverting to the largest cryptocurrency, it has decided to claim the spotlight with its recent price movement. Although propellants remain unclear, BTC has factored in a 1.15% price increase and is currently trading at the \$98.2K level. In the Asian morning hours, the cryptocurrency was trading at \$96,805. As bullish candles sparked during the day, Bitcoin hiked to its current price range. At the time of writing, Bitcoin was trading at \$98,244, according to CMC data. Such a price action in the past always triggered a buying trend among investors. However, according to analysts' reports, community members have continued to distribute their BTC holdings. #Bitcoin \$BTC Accumulation Trend Score suggests that larger entities (or a significant portion of the network) are either distributing or not accumulating! pic.twitter.com/gojXXcf1ie Ali (@ali_charts) February 21, 2025 Market analyst Ali reported that although not all of them are not distributing, investors are surely not accumulating Bitcoin. This makes us question the trading strategy and market movements. It also raises speculations about whether community members have resorted to focusing on the altcoins and pausing BTC trading. Will Bitcoin Sustain the Positive Momentum? On analyzing Bitcoin's recent price movements, it has recently shown a price consolidation, followed by a W pattern. The W pattern was followed by a brief descending channel and the current Horizontal channel pattern. This pattern indicates that Bitcoin might either witness a price breakout or further descent. When drawing inferences from other technical indicators, its Moving Average Convergence Divergence (MACD) MACD line recently crossed over the signal line. This reveals an incoming bullish trend. Furthermore, the digital asset's RSI value stands at 50.85 as per TradingView data depicting a neutral sentiment. On the other hand, other altcoins such as Aptos and Litecoin have shown bullish momentums having been propelled by the AltSeason.

What if you could go back in time and invest in Binance or Bitcoin Cash before they exploded in value? That's the exact kind of opportunity that's brewing right now—but this time, it's with Qubetics. With a presale surpassing \$13.4 million, early investors are locking in their positions before prices surge. Meanwhile, Binance is dominating the crypto space after being crowned the Best Crypto App in APAC, and Bitcoin Cash is making moves to strengthen its position with institutional investors. Qubetics (\$TICS) isn't just another crypto project—it's a Web3 aggregator that's setting new standards in multi-chain development, cross-border payments, and decentralized finance. While Bitcoin Cash and Binance are thriving in their own lanes, Qubetics is building the infrastructure for the next era of blockchain technology. If you're looking for the Best 100x Crypto to buy this week for exponential returns, this is where the smart money is going. Let's break down why Qubetics is stealing the spotlight while Binance and Bitcoin Cash continue to dominate in their own ways. Qubetics: A Web3 Powerhouse That's Redefining Crypto Innovation Crypto investors are always on the hunt for projects that solve real-world problems, and Qubetics delivers on that promise in ways that no other blockchain has. With its QubeCode IDE, Qubetics is revolutionizing Web3 development by allowing businesses, developers, and enterprises to build blockchain applications faster than ever. Unlike traditional coding methods that require complex programming skills, QubeCode provides an intuitive, AI-assisted drag-and-drop interface. Imagine a world where anyone—from solo developers to multinational corporations—can create smart contracts, DeFi applications, and NFT marketplaces with ease. That's what Qubetics is enabling, and it's why its \$TICS token is on track to becoming the Best 100x Crypto in 2025. Qubetics isn't just an Ethereum alternative—it's a Web3 aggregator that connects with all major blockchains, including Bitcoin, Ethereum, Solana, and more. The biggest issue in crypto today is interoperability, and Qubetics is solving it by enabling seamless communication between chains. Whether you're swapping tokens, developing dApps, or executing smart contracts across multiple chains, Qubetics ensures everything works smoothly, quickly, and without costly middlemen. The crypto industry is shifting towards real-world adoption, and Qubetics is leading the charge. Its focus on cross-border transactions and real-world asset tokenization makes it a game-changer for global commerce, digital payments, and decentralized finance. This isn't just another altcoin—it's a crypto infrastructure project that has the potential to power the next generation of blockchain applications. Qubetics Presale: The Clock is Ticking on the Biggest Opportunity in Crypto If you missed out on early-stage opportunities like Ethereum, Solana, or Binance Coin (BNB), Qubetics is your chance to get in early before a major breakout. - The Qubetics crypto presale has already raised \$13.4 million with over 481 million TICS tokens sold. - Each presale stage lasts just 7 days, and when it ends every Sunday at 12 AM, the price automatically increases by 10%. - Analysts predict that \$TICS could hit \$1 post-presale, translating into an 1138.69% ROI, with a \$10 price target giving investors a jaw-dropping 12,286.96% gain. Let's put this into perspective. If you invested just \$1,000 today at the current price of \$0.08073, and \$TICS reaches \$10 post-mainnet
