

Bitcoin's recent dip below critical support levels has raised concerns throughout the crypto community, once again underscoring the market's notorious volatility. As BTC struggles to regain traction, many investors are turning their attention to alternative assets that can better endure these market swings. One standout during these challenging times is Lightchain AI, a blockchain platform powered by artificial intelligence, built for scalability, automation, and practical applications. Currently in stage 15 of its presale, Lightchain AI is priced at \$0.007 and has already raised \$19.5 million, demonstrating strong investor interest despite the broader uncertainty in the market. Unlike traditional cryptocurrencies that are heavily influenced by market sentiment, Lightchain AI combines AI and blockchain to deliver sustainable value, making it an attractive choice for those seeking both stability and innovation in a turbulent market.

How Lightchain AI Maintains Stability in Volatile Crypto Market

While many cryptocurrencies face extreme price swings during market downturns, Lightchain AI has remained steady, thanks to its robust fundamentals and AI-powered blockchain technology. Unlike assets driven primarily by speculation, Lightchain AI leverages artificial intelligence to improve network performance, streamline operations, and boost scalability, reducing its exposure to sudden price changes. A major contributor to its stability is the Proof of Intelligence (PoI) consensus mechanism, which keeps the network efficient and adaptable, even in challenging market conditions. Furthermore, its practical use cases attract long-term investors who value utility over short-term profits. In an unpredictable market, Lightchain AI's forward-thinking design makes it a reliable and sustainable blockchain project, drawing the attention of those seeking consistency in the rapidly changing world of crypto.

Bitcoin's Recent Challenges Underscore Urgent Need for Innovation

The recent obstacles faced by Bitcoin are a stark reminder of the necessity for innovation to ensure its relevance in the ever-changing financial landscape. Scalability problems remain, with the network able to process around 3.3 to 7 transactions per second, and at busy times it becomes congested and costly. Another issue is environmental, as Bitcoin's energy-intensive proof-of-work consensus mechanism contributes a huge amount of carbon. Furthermore, quantum computing's increasing capabilities threaten Bitcoin's cryptographic security, forcing the need for quantum-resistant algorithms[1]. However, no matter how many challenges Bitcoin faces it is still hit or miss, being its strong decentralization to be our future Digital Gold. Adding to the complexity are regulatory uncertainties: Inconsistent policies between jurisdictions are restricting broad adoption. By being incorporated to those solutions like the use of Lightning Network to decrease scalability issue and the use of sustainable mining practice. This multi-faceted approach is vital to unlock the potential of Bitcoin while safeguarding its integrity in a rapidly evolving digital landscape. Can Lightchain AI Light Up Crypto World? Lightchain AI is making waves with a smart economic model designed for sustainability and investor confidence. With a fixed supply of 10 billion LCAI tokens, the distribution is strategically planned: 40% for presale, 28.5% for staking rewards, and the rest allocated to liquidity, marketing, treasury, and team development. The result? A balanced ecosystem and fair opportunities for everyone. But that's not all—Lightchain AI takes efficiency to the next level with dynamic gas optimization. Transaction fees adapt to task complexity, keeping things fast, efficient, and affordable. Pair this with a dynamic pricing model, and you have a platform built for stable growth and flexibility. For utility-focused investors, Lightchain AI isn't just another crypto project—it's a game-changer.

- Bitcoin approaches \$95,000 resistance as bullish momentum builds, with RSI near 67.63 and MACD showing positive divergence.

- Nasdaq's proposal and Semler's \$10M Bitcoin purchase boost institutional confidence, strengthening Bitcoin's bullish outlook. Bitcoin price is trading at \$94,380, showing a 0.79% increase in the last 24 hours. This upward movement has increased the cryptocurrency's market capitalization to \$1.87 trillion, with a 14.91% rise in 24-hour trading volume, now at \$35.39 billion. Despite some fluctuations throughout the day, Bitcoin remains a strong performer, continuing to attract significant interest in the crypto market.

Regulatory Clarity Strengthens Bitcoin's Appeal to Institutions

Nasdaq's recent push for the SEC to classify certain cryptocurrencies as securities while exempting Bitcoin could have a significant impact on institutional adoption. In an April 25 letter, Nasdaq proposed a new category called "digital asset investment contracts," which would provide regulatory oversight for tokens that do not qualify as stocks. This shift aims to establish clear guidelines for altcoins while preserving Bitcoin's unique status as a non-security reserve asset. This regulatory differentiation is a bullish signal for Bitcoin, as it provides a clearer path for institutional investors, such as hedge funds, pension plans, and corporate treasuries, to engage with the asset. With Bitcoin's separate classification, the cryptocurrency is becoming increasingly recognized as a safe and reliable asset, strengthening its bullish momentum. Semler Scientific recently added \$10 million worth of Bitcoin to its holdings, increasing its total Bitcoin position to over 3,300 BTC, valued at nearly \$300 million. This move contributes to a strong 23.5% year-to-date yield, driven by rising Bitcoin prices. Semler's purchase signals growing institutional confidence in Bitcoin's long-term prospects and adds to the cryptocurrency's positive market sentiment.

Bitcoin Eyes \$95K Resistance with Strong Technical Momentum

Bitcoin's price is currently nearing the key resistance level of \$94,922, an area identified by analyst Ali as a significant hurdle. The cryptocurrency has been struggling to maintain momentum above this point, and a breakout above this level could lead to higher targets, potentially reaching \$96,000 and beyond. However, if Bitcoin fails to break through this resistance, it may face a period of consolidation. The Relative Strength Index (RSI) stands at 67.63, suggesting that Bitcoin is nearing overbought territory, though there is still potential for further upside. The Moving Average

Convergence Divergence (MACD) shows a positive divergence, with the MACD line above the signal line, reinforcing the bullish sentiment. The histogram indicates continued buying pressure, as evidenced by the growing green bars. Source: TradingView Looking at key levels, the resistance remains at \$95,000. If Bitcoin surpasses this level, it could target \$96,000. On the downside, support lies around \$92,000, and if Bitcoin falls below this level, it could revisit lower levels, potentially around \$90,000. These technical levels will be crucial in determining Bitcoin's price direction in the short term. Highlighted Crypto News Today: Dubai Positions Itself as the Web3 World's New Crossroads

- The Swiss National Bank rejected adding bitcoin to its reserves due to high volatility. - Citizens are pushing for a referendum to include bitcoin for financial protection. - Switzerland stays cautious as other countries explore bitcoin reserves. Switzerland's famed financial conservatism clashed with the modern crypto wave as the Swiss National Bank firmly rejected to include bitcoin in its national reserves. As inflation concerns and geopolitical tensions rise globally, the supporters of digital currencies are pushing for Switzerland to adopt a more diversified approach, one that includes bitcoin alongside gold. But the SNB is not convinced. SNB Chairman Cites Volatility and Policy Concerns During its shareholder assembly in Bern on April 25, SNB Chairman Martin Schlegel dismissed the idea of adopting bitcoin as part of the bank's reserve strategy. He emphasised that cryptocurrencies like Bitcoin are far too volatile to be considered reliable reserve assets. "Cryptocurrency cannot currently fulfil the requirements for our currency reserves," Schlegel said, highlighting the SNB's need for highly liquid and stable assets. The recent push for bitcoin reserves comes as citizens prepare a referendum initiative aimed at compelling the SNB hold bitcoin. Advocates believe that adding bitcoin help protect Switzerland's financial stability amid growing global economic uncertainty. Particularly in light of market volatility sparked by geopolitical events, including U.S. tariff policy under Donald Trump. Schlegel, however, maintained that the SNB's reserves must serve the core purpose of implementing monetary policy effectively. Assets in these reserves need to be easily tradable and resistant to extreme price swings, criteria that bitcoin, in his view, fails to meet. Global Momentum Builds as Switzerland Holds Back This isn't the first time Schlegel voiced resistance. In March, he told Bloomberg Television that digital currencies lack the fundamental stability required by reserve assets. He also noted that cryptocurrencies are software-based and vulnerable to technical risks like bugs, which further diminishes their suitability. Meanwhile, the debate over national bitcoin reserves is heating up globally. In March, the U.S. made headlines by establishing a strategic bitcoin reserve using crypto seized in illegal cases. Other nations are exploring similar moves, while some, like Switzerland, remain cautious. Despite growing external pressure and changing global attitudes, the SNB is holding its ground, keeping crypto firmly out of its traditional playbook, at least for now. Highlighted Crypto News Today:

- Roger Ver pays Roger Stone \$600K to challenge tax charges and lobby for crypto law reforms. - Ver claims political persecution in a direct appeal to Trump, seeking a pardon and legal reform. Roger Ver, a pioneering figure in the cryptocurrency world known as "Bitcoin Jesus," has enlisted the help of Roger Stone, a longtime associate of President Donald Trump, according to the New York Times, to aid in his legal battle. Ver, facing federal fraud and criminal tax charges, has reportedly paid Stone \$600,000 since early February to challenge the tax provisions at the heart of the charges. Stone's lobbying efforts are reportedly focused on influencing Congress to reform cryptocurrency tax laws, particularly the controversial exit tax, which Ver argues is unfair and unclear when applied to digital assets. Ver Claims Political Persecution in Appeal to Trump Ver, who renounced his U.S. citizenship in 2014 and was arrested in Spain last year, is accused of evading taxes on \$48 million in cryptocurrency holdings. Ver disputes the charges, claiming that they are politically motivated and linked to his promotion of Bitcoin and cryptocurrency ideals. In a video posted in January, Ver suggested that he could face over 100 years in prison and directly appealed to President Trump, aligning his case with Trump's grievances about political persecution. The video, featuring imagery of Biden and Harris, aimed to draw parallels between Ver's situation and the challenges Trump has faced. For decades, I've been terrorized by rogue U.S. government agents who hate American freedom. " Roger Ver (@rogerkver) January 27, 2025 This is my story: pic.twitter.com/NEetn1b3r4 Stone's Role and Focus on Cryptocurrency Tax Reform In his filings, Stone confirmed that his main task is to advise Ver's legal team. Although Stone is closely associated with Trump, he explained that he has not directly lobbied the president or anyone in the executive branch regarding Ver's case. Instead, Stone's work has focused on pushing for the elimination of the exit tax and advocating for reform of cryptocurrency tax policies. Stone has engaged with lawmakers, arguing that digital currency laws are outdated and unfair, especially when applied to crypto investments. Trump's Influence and the Push for Pardons Stone and Ver also reportedly leveraged Trump's influence in the crypto industry, as the president has become a key ally since returning to office early 2025. The connection between Stone and Ver has generated demands for clemency for different crypto executives, such as Silk Road Founder Ross Ulbricht. Through his personal website, Stone released an article in December that supported the movement to pardon Ver alongside other crypto figures who wanted better treatment under Trump's administration. The crypto industry cases involving both Ver and prominent figures reveal current laws to obtain legal changes and possible pardons which shows how cryptocurrency ties to the United States political structure. Highlighted Crypto News Today: SUI Price Surges 68% as TVL Jumps to \$1.64B and DEX Volume Hits \$599M

- The aggressive acquisition of Bitcoin takes the total Bitcoin holdings investment of BlackRock to around \$1.16 billion. - BlackRock also bought \$40 million worth of Ethereum, leading to a slight shift in the price of ETH. BlackRock is continuously working to increase its digital asset holdings, and on April 25, it added another \$327.3 million of BTC and acquired around 12,500 BTC in the past three days. After this acquisition, the total Bitcoin holdings investment of BlackRock stands at around \$1.16 billion, showing the immense interest in cryptocurrencies. A Bitcoin and crypto enthusiast

posted on X that this move can indicate growing confidence in the crypto market from major financial players. **ðŸ’¥BREAKING: â€” Crypto Rover (@rovercrc) April 25, 2025 BLACKROCK JUST BOUGHT \$327.3 MILLION WORTH OF #BITCOIN THEY BOUGHT 12,500 \$BTC IN THE LAST THREE DAYS, TOTALING \$1.16 BILLION** pic.twitter.com/375kUhmLLd Following the information of BTC purchase by BlackRock, a sudden spike of 5.2% has been noted in the trading price of Bitcoin, the positivity has been mimicked by its volume, and the prices of other cryptocurrencies, which, the majority of the time, see a ripple effect due to bullishness in Bitcoin. On April 25, at 11:58 am IST, Crypto Rover reported that BlackRock bought \$40 million worth of Ethereum, leading to a slight shift in the price of ETH. As per Arkham Intelligence, BlackRock holds around \$1.142 million in Ethereum. Massive Inflows into iShares Bitcoin Trust ETF The strategic move of BlackRock is proving beneficial for its iShares Bitcoin Trust ETF, as it has continuously recorded a positive inflow since April 14, according to the data from CoinGlass. On April 24, it recorded a positive inflow of \$327.32 million, with a cumulative inflow of \$40.96 billion. A day before, Blackrockâ€™s IBIT witnessed a positive inflow of around \$643 million, and it is the biggest inflow in a single day since January 21, 2025. Nick Ruck, the LVRG Research Director, says: â€œThe current inflows of the ETF show a revived investor confidence in the store of value proposition of Bitcoin. Also, we could anticipate witnessing Bitcoin in line with the growth of gold in the future.â€ **Highlighted Crypto News Today: Coinbase Expands PayPal Partnership to Boost PYUSD Stablecoin Utility**

- Ark Invest raises Bitcoinâ€™s 2030 bull-case forecast to \$2.4 million, driven by institutional investment and Bitcoinâ€™s digital gold status. - Ark also increases bear and base case targets to \$500,000 and \$1.2 million, signaling strong growth potential. Ark Invest under Cathie Wood has recently boosted its Bitcoin price predictions to \$2.4 million for the year 2030 as part of the firmâ€™s bullish outlook. A detailed analytical approach has led to Ark Investâ€™s increased Bitcoin price prediction from \$1.5 million to \$2.4 million because institutions continue to amplify their investments while Bitcoin establishes itself as the new digital gold standard. Institutional Investment and Bitcoinâ€™s Role as Digital Gold The updated price projection at Ark results primarily from institutional investment activity. The price increase for Bitcoin will be driven by institutional participation according to Ark research analyst David Puell. Moreover, Puell forecasts that Bitcoin might acquire a 6.5% market share from the \$200 trillion financial market, which does not include gold, under optimal conditions. Institutional involvement with Bitcoin as an asset class drives most of this market growth. The business outlook for Ark remains optimistic because Bitcoin demonstrates its transformation from a mere digital currency into â€œdigital gold.â€ Research by Puell suggests Bitcoin may succeed in gaining 60% of the \$18 trillion gold market by 2030. This shift shows the growing recognition of Bitcoin as a store of value, positioning it as an alternative to traditional assets like gold. Bitcoin as a Safe Haven in Emerging Markets Puell describes BTC utilization in emerging markets as growing among organizations that treat it as digital gold by purchasing cryptocurrency. The decentralized nature, combined with easy entry barriers, attracts people in these markets who wish to protect their wealth against inflation through Bitcoin adoption. Puell estimates Bitcoin will obtain 13.5% of its \$2.4 million value assessment based on its function as a secure haven across developing markets. Emerging markets have long struggled with currency devaluation and inflation, but Bitcoinâ€™s decentralized nature offers a way to store value outside traditional financial systems. This use case could offer tremendous growth potential, as more people turn to Bitcoin to safeguard their wealth. **Ark Raises Bear and Base Case Scenarios for Bitcoinâ€™s Price** The analysts from Ark Invest increased their bear and base case Bitcoin predictions to \$500,000 and \$1.2 million respectively. The projection figures have increased substantially since the first two predictions of \$300,000 and \$710,000 during February. The new predictions use information related to Bitcoinâ€™s accessible market combined with its spread within the market and its planned supply releases. To achieve these new projections, Bitcoin would need to see compounded annual growth rates of 32% and 53% by the end of 2030. While these returns are rare for assets already valued in the trillions, Arkâ€™s projections suggest that Bitcoinâ€™s potential for growth remains strong in the years to come. **Highlighted Crypto News for Today Hedera (HBAR) Sees Surge in Bullish Sentiment as Long/Short Ratio Hits Monthly High**

- Bitcoin rebounds above \$93,000 after reaching \$94,700 on Tuesday. - Ki Young Ju remains skeptical despite price recovery from April lows. - Other analysts see current rally confirming long-term bullish trend. Ki Young Ju, the CEO of CryptoQuant, insists that Bitcoin must reach the crucial \$100,000 barrier before he would change his pessimistic assessment of the current market cycle, even in light of the cryptocurrencyâ€™s remarkable recent resurgence. Bitcoin has shown resilience this week and gained 2.71% on Monday, April 21, followed by a substantial 6.83% surge on Tuesday, April 22. This upward momentum brought Bitcoin above \$90,000 for the first time in almost a month, reaching a high of \$94,700â€”a figure not seen in seven weeks. Even with a minor 0.43% retracement today, Bitcoin has maintained its position above \$93,000, reigniting optimism among many market analysts. This recovery challenges Ki Young Juâ€™s previous assessment from March 18, when he declared the Bitcoin bull run was over as the cryptocurrency struggled near \$83,000. At that time, the CryptoQuant CEO highlighted several concerning factors, including diminishing liquidity, reduced ETF inflows, and the inability of large trading volumes to break through the \$100,000 resistance level. Following his bearish pronouncement, Bitcoin continued its downward trajectory, eventually dropping to \$74,000 on April 7â€”representing a 10% decline from the \$82,000 mark. Although BTC briefly rebounded above \$82,000 shortly afterward, it remained confined to the lower range of the \$80,000 level until this weekâ€™s rally. Ki acknowledges Bitcoinâ€™s impressive recovery In his latest update, Ki acknowledged Bitcoinâ€™s impressive recovery but emphasized that he remains unconvinced of a confirmed bullish trend unless prices break decisively above \$100,000. He plans to continue analyzing on-chain data over the coming weeks to determine whether the current momentum represents a genuine cycle reversal or merely a temporary bounce. Ki highlighted the challenges of relying on cyclical on-chain indicators in

a market that frequently responds unpredictably to news events, including political developments. He stressed that his analytical approach focuses primarily on fundamental supply and demand patterns rather than short-term price fluctuations. In contrast to Kiâ€™s cautious perspective, other prominent analysts have expressed stronger confidence in Bitcoinâ€™s current upward trajectory. According to market expert Miles Deutscher, Bitcoin has been on a long-term rising track since 2022, and the currency is still in a bull market. According to Deutscher, the latest decline only retreated to a crucial support point that aligned with the â€œParadise Money Noodleâ€ indicator, which has continuously served as a base for price rallies throughout the previous two years. Veteran trader Peter Brandt has also modified his perspective in reaction to the most recent bounce. Brandt had previously cautioned against Bitcoin even after it broke important resistance levels. According to Brandt, the rebound may indicate that the overall bullish trend will continue.

- Metaplanet has announced the acquisition of an additional 145 BTC, bringing its total holdings to 5,000 BTC. - In April alone, the firm purchased over 1,650 BTC, valued at approximately \$153 million. Metaplanet Inc., a publicly listed investment firm on the Tokyo Stock Exchange, has crossed a significant threshold in its long-term Bitcoin strategy. The company has acquired an additional 145 Bitcoins, pushing its total holdings to an impressive 5,000 BTC. This move places Metaplanet at the 50% mark of its plan to accumulate 10,000 Bitcoins by the close of 2025. The latest acquisition, announced by the company, was made at an average price of 13,280,472 yen, approximately \$93,327 per BTC. The total investment amounted to roughly \$13.6 million. According to Metaplanetâ€™s CEO, Simon Gerovich, this purchase marks a major step in the firmâ€™s objective to become one of the worldâ€™s largest corporate Bitcoin holders. He stated: â€œWe have reached 50% of our initial goal of 10,000 BTC by the end of 2025. This is a big step forward in our aim to become one of the worldâ€™s leading bitcoin holding companies. We will lead the global bitcoin race from Japan.â€ April Buying Spree of Metaplanet April 2025 has been particularly active for Metaplanet. The firm has bought around 1,650 BTC in five transactions, bringing close to \$153 million of BTC into its treasury. These aggressive acquisitions underscore the companyâ€™s confidence in Bitcoin as a long-term asset. Since launching its Bitcoin strategy in mid-2024, Metaplanet has secured close to \$745 million in funding. Yield Performance and Future Targets Significantly, from January 1 to March 31, 2025, the firm earned a Bitcoin yield of 95.6%. For the current quarter, covering April 1 through April 24, the firm has reported a yield of 13.0%, highlighting continued performance despite market fluctuations. Looking beyond 2025, Metaplanet has already set its sights on a broader target. Under its 21 Million Plan, the firm aims to accumulate a total of 21,000 Bitcoins by the end of 2026. The plan emphasises smaller, incremental purchases to avoid overpaying and to reduce shareholder dilution. Notably, Bitcoin has crossed over the \$90K mark following the recent recovery attempt. At press time, BTC has lost 1.11%, trading around \$92,633. The assetâ€™s trading volume has plunged by over 37%, reaching \$37.48 billion. Highlighted Crypto News

The United States proposed to buy 1 million bitcoins by August this year to build the countryâ€™s bitcoin reserves, which is undoubtedly a bombshell. Any statement from Trump or the US government may have a major impact on the world and shake the entire cryptocurrency market. Michael Saylorâ€™s strategy company announced today that the company purchased another 6,556 bitcoins at an average price of \$84,785 between April 14 and 20, spending about \$555 million to buy these bitcoins. These giants have made strategic deployments. In this article, we will tell you how to mine bitcoins using cloud mining. Mining bitcoins is better than buying bitcoins directly if you know what you are doing. he appeal of AI cloud mining Cloud mining is a form of cryptocurrency mining that allows individuals to rent computing power from remote data centers. In this process, users do not need to invest in expensive mining equipment or maintain it. AI cloud mining providers are responsible for equipment, electricity and maintenance costs, and users can earn cryptocurrency by renting computing power. What are the advantages of XY Miners? - Regulatory endorsement The company is registered in the UK in compliance with regulations, and its operations are regulated by the FCA financial institution. The transaction records are clear and the account system is standardized and transparent. - No installation required, zero maintenance burden Safe, efficient and stable-users do not need to purchase expensive hardware and maintenance equipment, XY Miners will bear all operating expenses. (No additional conditions and hidden fees.) - Flexible support for mainstream currencies XY Miners provides a variety of cryptocurrency payment methods. For example: BTC, ETH, USDT-ERC20, LTC, BCH, USDT-TRC20, XRP, SOL, DOGE, etc. - Multi-layer collagen asset protection mechanism The platform not only adopts account protection, but also adopts mechanisms such as cold and hot separation, encrypted channels, and dynamic risk control models to add multiple locks for user funds security. - Affiliate program The companyâ€™s affiliate program allows you to recommend your friends and get up to \$30,000 in referral bonuses. - Security guarantee McAfee® security protection. Cloudflare® security protection. 100% uptime guarantee and excellent 24/7 live technical support. How to get started with XY Miners? The first contact is not complicated, just follow the following three simple steps: 1. Register an account 2.Choose your contract combination The platform provides a variety of contracts, there is always one suitable for you, in addition, our contract plans all guarantee returns and are not affected by market fluctuations 3. Wait for income After purchasing the contract plan, the system will automatically connect to the mining process, and interest income will be calculated every 24 hours. Funds can be withdrawn or reinvested at any time. Safety and sustainability Trust and security are of utmost importance in the world of mining. XY Miners understands this and puts user safety first. XY Miners is committed to transparent and legal operations, ensuring your investment is protected so you can focus on profitability. All mining farms use clean energy, making cloud mining carbon neutral. Renewable energy protects the environment from pollution and brings rich returns, allowing every investor to enjoy the opportunity and benefits. Bitcoin Mining App Mining Bitcoin on your smartphone may sound too good to be true, but you can actually make money from it. For example, apps like XY Miners can help you earn a steady passive income. Most mining apps rely on cloud mining

technology instead of using your phone's hardware, making mining a safer and more energy-efficient way to mine Bitcoin. summary: If you are looking for ways to increase your passive income, XY Miners is a great choice. XY Miners can help you grow your cryptocurrency wealth in "autopilot" mode with minimal time investment. Passive income is the goal of every investor and trader, and XY Miners can help you maximize your passive income potential easier than ever before. For more information about XY Miners, visit the official website: <https://xyminers.com/> Disclaimer: TheNewsCrypto does not endorse any content on this page. - Bitcoin's market cap hits \$1.87T, overtaking Alphabet, trading at \$93,500. - Gold holds a \$12.9T market cap, valued at \$2,150 per ounce. - Bitcoin's volatility contrasts with gold's stability, highlighting their complementary roles. Bitcoin Overtakes Alphabet As of April 23, 2025, Bitcoin (BTC) and gold remain at the forefront but in different positions within international portfolios. The market capitalization of Bitcoin has just broken Alphabet's valuation to stand at about \$1.87 trillion and solidify its place as the fifth-largest asset globally. Gold, for its part, holds an estimated value of \$12.9 trillion, reinforcing its historical position as the safe-haven asset of choice. Bitcoin's approach to almost \$100,000 per coin testifies to increased institutional demand and increasing acceptance of digital assets. Trading during the day saw BTC around \$93,500 on the back of encouraging signs from the EU's forthcoming Markets in Crypto-Assets regulation and new talk about U.S. policy towards digital money. Gold's Stability vs. Bitcoin's Volatility: Conversely, gold traded around \$2,150 per ounce on the back of geopolitical tensions in Eastern Europe and defensive positioning before a forthcoming Federal Reserve meeting. Volatility is still the hallmark of Bitcoin. Its price fluctuations create chances for the big upsides but also present considerable risk. On the other hand, gold's price action is more subdued, providing stable, if dull, returns. This has caused many investors to see Bitcoin and gold as complementary assets: gold the portfolio anchor during times of uncertainty, with Bitcoin providing the potential for a large move. Even as Bitcoin shot up into the limelight, it would not replace gold altogether. The long-standing rule book governing gold, central banking reserves, and a history going back millennia accord a certain cache that digital forms have not entirely achieved. Alternatively, both asset classes are also set to survive together. Stability in gold would remain attractive for risk-averse investors, while the growth in Bitcoin would allure those prepared to take greater risks for the reward of significant payoff. Highlighted Crypto News Today Pi Coin Price Prediction Today: Can It Break \$1 Before 223M Tokens Unlock?

- As the price of Bitcoin and Ethereum increased, the crypto market faced a mass liquidation of over \$654.22 million. - Bitcoin saw liquidations totaling \$321.73 million as its price surged over 6%, crossing \$94,000 on April 23. The crypto market saw mass liquidations over the past 24 hours, totaling \$654.22 million. Around 172,659 traders were wiped out " mostly from short positions " highlighting growing pressure on bullish sentiment. The largest cryptocurrency, Bitcoin (BTC) liquidated \$321.73 million as its price gained more than 6% and went over \$94,000 on April 23. In the past 24 hours, around 7,023 BTC were bought and around 72,637 BTC were sold, as per the data from Cryptometer.io. The second position with the highest liquidation is captured by Ethereum, marking \$134.30 million. The price of Ethereum also rebounded today by skyrocketing 10% and hovering around \$1,700. In the last 4 hours as well as 24 hours, Bybit is accountable for the largest portion of liquidations, standing at \$14.77 million and \$267.45 million respectively. After Bybit, Binance holds the second position, having liquidated nearly \$131.59 million. Long-term Term Whales Cashing Out, Following The Recent Spike After the recent spike, long-term whales are cashing out their digital assets swiftly. The Blockchain Analytics Platform, Lookonchain, reported on X that a whale borrowed 15,000 ETH from Aave to sell and then withdrew all 35,754 ETH and then dumped it at an average price of \$1,794 in the last 3 hours. Another post of the platform mentioned that after the surge in the price of BTC, 2 wallets shorted BTC with 6x leverage at \$92,469.1 and \$92,664.8. Highlighted Crypto News Today: Binance Updates Crypto Transfer Rules in South Africa Amid Regulatory Push

- Bitcoin (BTC) briefly hit \$93,847 during Asian trading hours, its highest level in over seven weeks. - While Bitcoin shows bullish momentum, the 4-hour chart hints at a possible short-term pullback before further gains. Bitcoin made headlines early Wednesday after briefly touching intraday high of \$93,847 during Asian trading hours"its highest level in over seven weeks. The world's largest cryptocurrency gained momentum as investor confidence improved due to positive signals from global markets and politics. The rally in the BTC price came as traders reacted to two key developments. First, there were encouraging updates about the U.S. and China trade tensions with U.S. officials showing a more diplomatic tone. Second, U.S. President Donald Trump eased concerns by saying he had "no intention of firing" Federal Reserve Chair Jerome Powell"just days after calling for his removal. These signals boosted investor appetite for riskier assets, including Bitcoin and gold. Over the past 24 hours, Bitcoin has risen over 5.6% and is up more than 12% in the last seven days, according to CoinMarketCap. The surge included a rapid jump from \$91,500 to over \$93,000 in just a few minutes, leaving traders surprised. "This is the craziest one-minute candle I've ever seen on the Bitcoin chart," said crypto analyst Michael Sullivan. At the time of writing, BTC has slightly retraced and is currently priced at \$93,721 with a market cap of \$1.86 trillion. Additionally, the daily trading volume of Bitcoin soared by over 50% to \$57.5 billion. This raises the question: will Bitcoin sustain the rally, or are more pullbacks on the way? Bullish Breakout: Bitcoin Surpasses Key Resistance Levels From a technical perspective, Bitcoin has broken out of a falling wedge pattern"a bullish sign. On the daily chart, it passed major resistance near \$91,600 (0.786 Fib level), supported by increasing momentum on the MACD (bullish crossover) and a strong RSI reading of 67.5, suggesting

thereâ€™s still room for growth. If this momentum continues, the next target could be around \$100K, with a possible extension near \$107,600. On the shorter 4-hour chart, however, the RSI has entered the overbought zone at 83.4, suggesting a possible short-term pullback or consolidation. The MACD remains bullish with Bitcoin in an ascending channel and recently broke to the upside, showing short-term strength. But the current rally may slow down before continuing higher. Overall, both charts show bullish momentum, but the 4-hour chart suggests a short-term pause. Looking ahead, analysts are watching whether Bitcoin can maintain this momentum and aim for the \$100,000 milestone. Standard Charteredâ€™s Geoffrey Kendrick remains bullish, predicting that Bitcoin could hit \$200,000 by the end of 2025 and even \$500,000 by 2028. Kendrickâ€™s optimism stems from Bitcoinâ€™s growing as a safe haven during the current financial uncertainty. So now all eyes on the \$100K target with short-term charts showing strength but also warning of a possible brief cooldown before the next leg up.

- A \$3 billion Bitcoin venture is planned by Cantor Fitzgerald along with SoftBank, Tether, and Bitfinex. - Cantor Fitzgerald plans to set up â€21 Capitalâ€ and follow the lead of MicroStrategy in Bitcoin accumulation. Cantor Fitzgerald is stepping forward to create a Bitcoin investment vehicle. The son of the US Commerce Secretary, Howard Lutick, leads the firm and plans to initiate a \$3 billion Bitcoin venture. This initiative gathered support from other industry giants such as SoftBank, Tether, and Bitfinex. The Financial Times reported earlier today regarding Cantor Fitzgeraldâ€™s plan to create a Bitcoin venture. It stressed the contribution of favorable crypto policies in the country to Cantorâ€™s plans. The collaboration of Cantor with SoftBank, Tether, and Bitfinex aims to create a multi-billion-dollar Bitcoin investment vehicle. Cantor Fitzgerald to Follow the Lead of MicroStrategy People familiar with this matter revealed the news to the Financial Times. They also mentioned that this collaboration aims to mirror the success of MicroStrategy. Strategy, formerly known as MicroStrategy, is originally a software solution company, but gained popularity after it started acquiring Bitcoin. Strategyâ€™s latest Bitcoin purchase of 6,556 Bitcoins has fostered Strategyâ€™s position as the top corporate firm in terms of Bitcoin holdings. The firm has made it a tradition to announce its stock offerings and use the funds for Bitcoin purchases. Bloomberg also reported Cantor Fitzgeraldâ€™s plans to establish a Bitcoin venture. The firm plans to follow the lead of Strategy in terms of Bitcoin acquisition, but it aims to create a publicly listed alternative entity to Strategy. This Bitcoin investment vehicle will be named 21 Capital as per the Financial Times report. Cantor will receive the following amount of funds from its partners. - SoftBank â€ \$900 million - Tether â€ \$1.5 billion - Bitfinex â€ \$600 million Furthermore, Cantorâ€™s upcoming Bitcoin investment vehicle will also raise an additional \$350 million from convertible bonds. A private placement of equity will bring another \$200 million to help Cantor in its Bitcoin purchases. All of these funds will eventually create 21 Capital and will be used for Bitcoin acquisition. Highlighted Crypto News Today: Tesla Maintains \$951M Bitcoin Position Despite Earnings Shortfall

- Tesla maintains 11,509 Bitcoin worth \$951 million in Q1 2025, with holdings now exceeding \$1 billion due to recent price increases. - The firm missed earnings expectations with \$0.27 per share. Tesla continues to invest substantially in Bitcoin even though Q1 2025 financial performance proved unsatisfactory. The April 22 earnings report from Tesla shows the company maintains 11,509 Bitcoins worth \$951 million as of March 31. However, the value decreased from \$1.076 billion at year-end because Bitcoin prices in the market changed. Tesla maintains its Strategy Without Changes Despite Its Business Difficulties The electric vehicle manufacturer has maintained an unaltered Bitcoin position in the first quarter despite facing difficult times for its main automotive operations. Teslaâ€™s Bitcoin investment strategy reached over \$1 billion again after the cryptocurrency surged to \$93,000. This demonstrates both the market risks and potential benefits of this investment method. Tesla maintains a consistent cryptocurrency approach that creates a striking difference from its overall business performance. Its adjusted earnings per share reached \$0.27 below the range of \$0.41-\$0.42, which analysts had forecast. Tesla reported a 9% drop in annual revenue, which reached \$19 billion. Automotive revenue underwent a 20% decline due to a fall in deliveries, mixed with continuous price adjustments. The company registered a 13% drop in vehicle deliveries since last year, while production levels decreased by 16%. Its production decline occurred because Tesla needed to update four Model Y production lines. The energy division of Tesla proved to be a positive point in their report, with revenue growth reaching 67% compared to the previous year. Additionally, regulatory credit revenue rose to \$595 million from \$432 million a year earlier. Elon Musk announced plans to reduce his involvement in D.O.G.E to focus more on Tesla. This directed to a 5% increase in Tesla stock prices in after-hours trading, even though the companyâ€™s stock had declined by 41% throughout the year. Highlighted Crypto News Today: Oregon Sues Coinbase Over Unregistered Crypto Tokens Including XRP and ADA

- Analyst projects 13X gains for Cardano based on technical trend analysis. - Calculation combines 4.5X increase in ADA/BTC ratio with 3X Bitcoin growth. - Longer-term projections suggest potential \$10-\$20 range by 2030. Crypto analyst Nick Valdez, known professionally as Deezy, has provided a detailed projection for Cardanoâ€™s potential price trajectory should Bitcoin reach the \$250,000 milestone, suggesting ADA could achieve gains of approximately 13X from current levels. Cardano has displayed remarkable resilience in recent market conditions, maintaining stability and gradual upward momentum despite widespread volatility. Currently trading at \$0.6444, ADA has registered a 3.12% increase over the past 24 hours and a modest 0.56% gain across the seven-day period. In a recent analysis, Valdez examined Cardanoâ€™s performance against Bitcoin using the ADA/BTC trading pair on weekly charts. He identified a long-term descending resistance trendline. The analyst also noted that ADA recently lost support at a lower trendline. According to Deezy, these trend levels attract significant attention from large-scale investors due to historical price reactions at these boundaries. Analyst advises Cardano holders to be patient The analyst pointed out that Cardano currently trades at approximately 740 satoshis, substantially below its 2021 peak of 6,000 satoshis.

Building on this technical foundation, Deezy developed a price projection based on a scenario where Bitcoin reaches \$250,000—a forecast recently shared by Cardano founder Charles Hoskinson, who suggested BTC could approach \$245,000 either this year or next. Valdez’s calculation methodology combines multiple growth factors. Starting with ADA’s current value of approximately \$0.62, he applies a projected 4.5X increase in the ADA/BTC ratio, then multiplies this by an anticipated 3X increase in Bitcoin’s dollar value. This formula yields a projected ADA price of \$8.39, representing a substantial 1,250% increase from current levels. “This projection avoids both overly conservative and wildly speculative extremes,” Deezy emphasized. “It’s grounded in historical trend analysis and realistic market behavior.” The analyst highlighted the growing relevance of Bitcoin DeFi and the UTXO model as areas where Cardano is particularly well-positioned for future growth. Based on these factors, Deezy advised ADA holders to maintain patience rather than selling prematurely, suggesting significant upside potential may emerge in the coming market cycle.

- ETH/BTC exchange rate falls to 0.01791, lowest since 2020. - Galaxy Digital, Paradigm, and Ethereum Foundation shuffle millions worth of ETH. - ETH’s staking ratio at 28% lags behind competitors like Solana. The Ethereum market is facing mounting pressure as the ETH/BTC exchange rate has plummeted to its lowest level in nearly five years, according to recent TradingView data. The ratio has fallen to 0.01791, marking a significant decline in Ethereum’s value relative to Bitcoin not seen since 2020. This downward trend coincides with increased selling activity from major institutional players and “whales” in the Ethereum ecosystem. According to blockchain expert OnchainDataNerd on X, Galaxy Digital sent an extra 5,000 ETH (about \$8.11 million) to Binance on April 22, 2025. Major firms reducing Ethereum exposure As previously revealed on April 18, 2025, Galaxy Digital moved about \$100 million worth of ETH to exchanges in a few days prior to this transaction. There are other significant companies lowering their exposure to Ethereum besides Galaxy Digital. Three hours before Galaxy’s transaction, Paradigm sent Anchorage Digital 5,500 ETH, which is worth around \$8.65 million as per EmberCN. Furthermore, Lookonchain discovered that 1,000 ETH was sent to the Kraken exchange from an address connected to the Ethereum Foundation. These substantial movements from institutional holders are placing significant downward pressure on Ethereum’s price at a time when the token is already struggling against Bitcoin’s dominance. Currently, ETH is trading at \$1,574, representing a 2.5% decline over the past 24 hours, while Bitcoin approaches the \$90,000 mark. The widening performance gap between the two largest cryptocurrencies may prompt investors to shift their allocations toward Bitcoin, potentially intensifying the selling pressure on Ethereum. The Ethereum Foundation’s history of multiple recent ETH sales further suggests that these large institutional transactions can significantly impact price volatility and impede Ethereum’s growth trajectory. Beyond whale activity, ETH faces additional challenges that may be contributing to investor hesitation. The network’s staking ratio currently stands at just 28%, substantially lower than competitors like Solana, which boasts a 65% staking ratio. This disparity, coupled with less attractive staking yields compared to alternatives, may be eroding investor confidence in ETH as a long-term holding. Bitcoin’s market dominance has reached a four-year high, indicating capital is flowing away from Ethereum and other alternative cryptocurrencies. This trend could exacerbate ETH’s relative underperformance if it continues. Despite these concerning short-term signals, some experts maintain optimism about Ethereum’s long-term prospects.

- US spot Bitcoin ETFs saw \$381.40 million in inflows on April 21, the most significant one-day surge since January. - The spike came as political drama and trade fears rattled traditional markets. - Ethereum, by contrast, continues to struggle “with eight weeks of ETF outflows and nearly \$1 billion in redemptions. U.S.-listed spot Bitcoin ETFs just had their best day in nearly three months. On April 21, these funds attracted a whopping \$381.40 million in new money, the highest daily total since late January. data from SoSoValue revealed ARK 21Shares Bitcoin ETF (ARKB) led the charge with \$116.13 million inflows, followed by Fidelity’s FBTC, which pulled in \$87.61 million. Even Grayscale’s GBTC, which had been losing investors for months, saw a positive reversal with \$36.60 million coming in. It’s a clear sign that institutional investors “the big players on Wall Street” are moving back into Bitcoin. The timing is no coincidence. Just days earlier, Donald Trump publicly attacked Fed Chair Jerome Powell, where he called for Powell’s removal and criticized him for delaying interest rate cuts. That post on Truth Social sent shockwaves through markets, and crypto may benefit from the fallout. This ETF surge isn’t happening in a vacuum. Trump’s push to fire Powell has sparked real concern about the Fed’s stability, and ongoing U.S.-China trade tensions have only added fuel to the fire. Investors are looking for something solid “and this week, that was Bitcoin. Ethereum Left Behind as Bitcoin Steals the Spotlight Not everything in crypto is getting love right now. While Bitcoin ETFs are raking in cash, Ethereum (ETH) ETFs are still bleeding, with another \$25.4 million outflows on the same day. That makes eight straight weeks of losses, adding up to \$910 million in redemptions since February, based on SoSoValue data. The split between Bitcoin and Ethereum is getting clearer by the day. Bitcoin is treated like digital gold “something to hold during uncertain times” while Ethereum struggles to convince investors it offers the same safety. Meanwhile, trading indicators are flashing green for Bitcoin. Futures activity is heating up, and funding rates are rising “all signs that the market thinks Bitcoin’s run could continue. ARKB has now accumulated over \$2.6 billion worth of Bitcoin through investor purchases, while BlackRock’s IBIT pulled in another \$41.6 million. These aren’t quick trades. This is long-term positioning from firms that usually play it safe. And the timing couldn’t be more telling. Instead of panicking during a rough week for stocks, these big players doubled down on Bitcoin. That speaks volumes. Highlighted Crypto News for Today Ethereum Observes a Breakout as Bearish Trend Extends: Can Bulls Step In?

- BTC whale activity is also on the rise, which bodes well for the future of the crypto market. - Optimistic Bitcoin price prediction provided by Kiyosaki: \$180,000 to \$200,000 in 2025. Prominent

author Robert Kiyosaki has set a lofty goal for 2025, coinciding with Bitcoin's significant price climb today, which surpassed the \$87K milestone. The author of Rich Dad, Poor Dad recently expressed optimism in an X post, predicting that the king cryptocurrency would soon have a breakthrough. Furthermore, new data suggests that BTC whale activity is also on the rise, which bodes well for the future of the cryptocurrency market. Optimistic Bitcoin price prediction provided by Kiyosaki: \$180,000 to \$200,000 in 2025. The flagship cryptocurrency was selling at \$84,000 when Kiyosaki made his prediction, which indicated a substantial potential increase for the asset. Banking on Bitcoin The author has said optimistic things about Bitcoin before. He has long stressed the need of protecting one's wealth from economic uncertainty by amassing Bitcoin, gold, and silver. At the same time as he is warning of an imminent economic slump, Kiyosaki is optimistic about Bitcoin. The "biggest stock market crash in history" is what he's predicting, and he thinks the United States is about to go into despair. Bitcoin, gold, and silver will be safer investments at this period, says Robert Kiyosaki. Notably, market aficionados have taken to discussing the prognosis, with many offering their thoughts on the possibility of Bitcoin's price reaching new levels. On top of that, it follows a string of good patterns that point to a further advance northward. Concurrently, Robert Kiyosaki's forecast that Bitcoin would reach \$1 million by 2035 also garnered attention last week. At the time of writing, Bitcoin is trading at \$87,514, up 4% in the last 24 hours as per data from CMC. Highlighted Crypto News Today: Metaplanet Boosts Holdings Amid Market Volatility By Adding 330 BTC

As the crypto market continues to grow, smart investors are turning their attention to altcoins with significant growth potential, especially those priced under \$5. Top contenders include Lightchain AI, Dogwifhat (WIF), and Cardano (ADA), which are expected to outperform Bitcoin (BTC) and Ripple (XRP) by 2025. Lightchain AI is particularly noteworthy for combining blockchain technology with artificial intelligence. Currently in its presale phase at just \$0.007 per token, it has already raised \$19.3 million, reflecting strong investor interest and promising future growth. Why Low-Cost Altcoins Could Shine in the 2025 Market As we look towards 2025 "low-cost altcoins garner attention for their potential to offer huge returns. All of these best cheap cryptocurrencies to buy under dollar can provide investors with a low entry point and potentially high upside. Furthermore, real-world use cases for Altcoin projects, like Lighchain AIs supply chain offering or Stellar for cross-border payments, are drawing interest due to their utility and growth potential. These low-cost altcoins offer potential for huge profits as the crypto market evolves, particularly for investors looking to diversify their portfolios with emerging assets. 3 Altcoins That Could Outshine Bitcoin and Ripple Lightchain AI, Dogwifhat (WIF), and Cardano (ADA) are gaining momentum as altcoins with the potential to outperform big names like Bitcoin and Ripple. Lightchain AI stands out by combining blockchain technology with artificial intelligence, enabling secure and decentralized AI processes—a feature poised to drive significant growth across industries. Dogwifhat (WIF) is making waves with its innovative design and strong, community-focused development, leading to its rising market influence. Meanwhile, Cardano (ADA) continues to impress with its research-based approach, prioritizing scalability and sustainability, which makes it a key player in the decentralized applications space. With these unique strengths and forward-looking strategies, these altcoins have the potential to deliver exceptional returns, possibly surpassing Bitcoin and Ripple as the cryptocurrency market evolves. Lightchain AI- Game-Changer in Blockchain and AI " Get In for Under \$5! The buzz around Lightchain AI is real! This revolutionary platform is shaking up the blockchain and AI worlds, solving the biggest hurdles holding back mass adoption. It's not just disrupting industries—it's creating entirely new opportunities. If you're eyeing long-term growth, this is the investment you don't want to miss. So, what makes Lightchain AI stand out? A dream team of seasoned pros and visionary advisors—top entrepreneurs and technologists—are behind it, driving innovation and delivering results. This isn't just a platform; it's a movement set to reshape industries as we know them. Ready to join the revolution? LCAI tokens are up for grabs at just \$0.007. - Bitcoin has shown a 2.54% gain in the past 24 hours and is now trading at \$87k. - As per the market experts, the full-blooded global trade war is one of the prominent reasons driving this push. - Some other reasons impacting Bitcoin's path are the increasing role of institutions and financial products such as ETFs. Bitcoin strongly rebounded on April 21, surpassing the \$87k mark from its 2025 low of \$75,000, which was recorded on April 9. According to CoinMarketCap data, the current price of Bitcoin is the highest since March 28. On April 20, BTC hit its intraday low of \$84,000 and has gained over \$3,000 or 2.54% in the past 24 hours. However, witnessing a gain of 2.54% is not new for Bitcoin, but surpassing the \$87k mark is something that has once again gained attention from many investors. The asset has also shown an increase of 4.20% and 3.86% in the past seven days and past month, respectively. The volume of the token in the past 24 hours has also shown an increase of around 66%. The technical analysis of the market shows if the bullish sentiments continue to propel in coming sessions Bitcoin is to test the nearest resistance of \$91,745 followed by the 2nd nearest resistance of \$96,086. On the other hand, if the trend is reversed then, it could fall to the first support level at \$77,692 and second support level at \$73,351. Experts Outlook On The Surge As per the market experts, the full-blooded global trade war is one of the prominent reasons driving this push. This trade war could potentially impact the private consumption of the U.S., which accounts for around 60% of GDP, and may push the price even higher. The experts also argue that stagflation and a US recession will have an influence on cryptocurrencies, and mainly Bitcoin. Some other reasons impacting Bitcoin's path are the increasing role of institutions and financial products such as ETFs. The co-

founder of Strategy, Michael Saylor, has recently stated that “Bitcoin has no counterparty risk. And, this is the essence of what makes \$BTC truly revolutionary.” As per Saylor, Bitcoin is not only a digital currency, but it is a movement that has reshaped how everyone looks at value, ownership, and freedom. Vugar Usi Zade, the COO at Bitget, reveals that the recent institutional demand could skyrocket BTC over \$90k and even higher. He further mentioned that the time for the price reaction is not fixed and it depends on broader market movements.

- The prediction of Kiyosaki that Bitcoin will hit \$1 million is highly backed by the fact that the traditional finance system is collapsing. - The author often advises investing in BTC, gold, and silver, as these are safer investment products. A self-proclaimed Bitcoin advocate and the writer of the book Rich Dad Poor Dad, Robert Kiyosaki, has once again made claims related to the price of Bitcoin. Kiyosaki posted on X (formerly Twitter) on April 19 that the price of Bitcoin will touch the \$1 million mark by the year 2035. Apart from Bitcoin, he predicted that the price of gold would hit \$30k and silver \$3000 a coin by that year. His post showed a concern relating to 2025 credit card debt being at an all-time high, increasing unemployment, and theft of pensions. He also asserted that the USA may be heading for a greater depression. Kiyosaki often tweets on X relating to stock market prices, Bitcoin price predictions, and so on, and he portrays his image as a foreseer. In the recent post, he also claimed that he had forecasted the upcoming biggest stock market crash in history in his book Rich Dad’s Prophecy, and he also warned people about the same. As per his claims, the people who heeded his warnings are not facing any difficulties. However, he asserts that he is concerned about those people who didn’t heed the warnings. The prediction of Kiyosaki that Bitcoin will hit \$1 million is highly backed by the fact that the traditional finance system is collapsing, and the USA is stuck in a quagmire of debt. The author often advises investing in BTC, gold, and silver, as these are safer investment products, and they can help in economic uncertainty. A Dive into Today’s BTC Price At the time of writing, the price of BTC was 0.75% up in the past 24 hours and hovering around \$85,193. However, the volume in the same time frame has dropped by 34.50% and is currently standing at \$13.52 billion. The overall market capitalization of BTC is \$1.69 trillion, and the data from CoinMarketCap shows that the community is showing bullish sentiment. Highlighted Crypto News Today: Core (CORE) Price Surges 19% as Buyers Push Toward Key Breakout

- Altcoin Oracle predicts massive Cardano price surge based on Bitcoin DeFi integration. - ChatGPT analysis suggests Cardano market cap could reach \$500 million to \$1 trillion. - Partnership aims to bring smart contract functionality to Bitcoin’s \$1.6 trillion ecosystem. A prominent Cardano ecosystem participant has excited the community with a bold prediction that ADA could reach \$20 if a recently announced partnership achieves its full potential. Altcoin Oracle, a delegated representative (DRep) in Cardano’s newly implemented decentralized governance system, shared this optimistic outlook in an April 17 tweet. The prediction is mainly based on a strategic partnership between the Cardano and Bitcoin ecosystems. This aims to launch Cardano as a primary Bitcoin decentralized finance (DeFi) enabler. To substantiate this forecast, Altcoin Oracle consulted AI assistant ChatGPT to analyze potential price targets and ecosystem impacts. This collaboration originated last year when Cardano’s development arm, EMURGO, partnered with BitcoinOS to introduce DeFi capabilities that leverage Bitcoin’s network. Cardano founder Charles Hoskinson has emphasized that this initiative represents the ecosystem’s main focus for the current year. The ambitious project aims to unlock smart contract functionality for Bitcoin developers while simultaneously tapping into Bitcoin’s massive \$1.6 trillion liquidity for the benefit of the Cardano ecosystem. According to Hoskinson, this innovation could potentially surpass DeFi implementations on both Ethereum and Solana blockchains. Cardano market cap predicted to surge ChatGPT’s analysis, as shared by Altcoin Oracle, projected that Cardano’s market capitalization could surge to between \$500 million and \$1 trillion by 2030 if the network successfully establishes itself as Bitcoin’s primary DeFi platform. This growth would be driven by liquidity influx and increased institutional adoption. Based on a hypothetical supply of 50 billion ADA, these market cap projections would translate to a price range of \$10 to \$20 per token representing a staggering increase of 1,522% to 3,144% from current levels. If Cardano maintains its current supply of 35.28 billion ADA, the price potential increases further to between \$14 and \$28. The current DeFi landscape shows Ethereum commanding \$46.32 billion in TVL according to DeFiLlama, representing approximately 52% of all value locked across crypto networks. By contrast, Cardano’s TVL stands at just \$288 million. It is trailing behind newer networks like Aptos (\$973 million) and also Sui Network (\$1.2 billion). This partnership exemplifies Cardano’s strategic approach to ecosystem growth by bridging with Bitcoin’s established liquidity and user base rather than competing directly. As this collaboration develops, it will be closely watched by both communities to see if it can deliver on its ambitious technological and financial promises.

- Bhutan has mined over \$600 million in Bitcoin using 100% clean hydropower, enough to fund two years of public sector salaries. - With backing from the King and Prime Minister, Bhutan plans to scale its hydropower to 33 GW and become a global leader in green crypto infrastructure. Bhutan, a country strategically located between China and India, is becoming a leader in sustainable crypto mining. It is leveraging its natural resources for a unique economic future. According to data from Arkham Intelligence, Bhutan has mined over \$600 million in Bitcoin (BTC), which was powered by entirely clean hydropower. The Bitcoin mined was estimated to be enough to cover two full years of government salaries while maintaining a net-zero carbon footprint. The initiative managed through Bhutan’s sovereign wealth fund, Druk Holding and Investments (DHI), began in 2019 as part of a broader strategy to diversify the economy and bolster foreign reserves. With 3.5 gigawatts (GW) of hydropower capacity and plans to scale to 33 GW, Bhutan is converting its abundant natural energy into Bitcoin in a move that’s as much about economic independence as sustainability. “We’re a nation running 100% on hydropower. Every Bitcoin we mine offsets another that would have relied on fossil fuels,” said Ujjwal Deep Dahal, CEO of DHI. Bitcoin as an Economic Catalyst Bhutan’s crypto operations are not a

speculative detourâ€”theyâ€™re central to a national plan to modernize and fortify the economy. DHI treats Bitcoin and Ethereum holdings as strategic financial assets, now estimated to account for nearly 30% of Bhutanâ€™s GDP. These digital reserves are helping the country build a financial cushion while expanding its presence in the global tech landscape. Prime Minister Tshering Tobgay has publicly endorsed the strategy in an interview, calling Bitcoin mining â€œsmart economics,â€ especially amid youth unemployment, which hit 16.5% in 2024. Over 10% of Bhutanâ€™s youth migrated abroad between 2022 and 2023, so the government is turning to blockchain and AI industries to create domestic jobs and retain talent. King Jigme Khesar Namgyel Wangchuck has reportedly backed sweeping digital infrastructure investments, indicating top-level alignment with Bhutanâ€™s tech-forward vision. In a world where many countries are seizing crypto assets, Bhutan is building themâ€”cleanly and legallyâ€”from the ground up. Green Crypto Scaling to 33 GW Looking ahead, Bhutan aims to expand its hydropower capacity from 3.5 GW to 33 GW over the next 10 to 15 years. That level of energy output could support large-scale data centres, AI compute clusters, and mining farms while also exporting surplus power to neighbouring countries. This makes Bhutan a rare example of sustainable blockchain infrastructure on a national scale. As ESG mandates tighten worldwide, climate-conscious firms and institutional investors are increasingly interested in Bhutanâ€™s â€œgreen coinsâ€â€”cryptocurrencies mined without fossil fuels. â€œBitcoin has not only enhanced the value of our hydropowerâ€”it has also opened up new channels for liquidity in foreign currency,â€ Dahal added. These plans also align with Bhutanâ€™s goal of positioning itself as a regional digital leader, capitalizing on the rising demand for carbon-neutral assets and tech-ready infrastructure. Bhutan may be small, but its strategy is drawing global attention. With El Salvador holding over \$550 million in BTC, Bhutan now leads El Salvador in global crypto adoption, claiming over \$600 million ownership in BTC. The United Statesâ€™ strategic bitcoin reserve and institutional crypto adoption are other strengths of digital currency and its evolution. What sets Bhutan apart is the integration of environmental, economic, and digital priorities into a single framework. While countries like France and the Central African Republic explore Bitcoin legalization, Bhutan is actively mining, accumulating, and preparing to export clean crypto value. Itâ€™s not just adopting Bitcoinâ€”itâ€™s optimizing it. Highlighted Crypto News for Today FTT, ZEC and JASMY Lead Binanceâ€™s Latest Community Delisting Vote

- Bitcoin is repeatedly failing to hold the price above \$86K over the past month. - The cryptocurrencyâ€™s daily trading volume has shown a dip of 13.18% as per CMC data. In the last 24 hours, the crypto market has shown a modest upward movement. The overall market cap shows a slight increase of 1.17%, however, the overall consolidation still remains. On the other hand, the ETF market saw some action with VanEck filing for a new ETP product. Regulatory actions in crypto continue uninterrupted. Notably, on reverting to the crypto market, Bitcoin is currently docked at the \$84K level. Over the past day, BTC revisited its \$83K support before moving upwards. While this has seen a modest positive effect in altcoins such as Solana, BTC still has a long way to go. In the afternoon hours of April 16, the cryptocurrency was trading at a low of \$83,586. However, as bullish candles sparked it rose to current levels. At the time of writing, Bitcoin was trading at \$84,378.02 as per CMC data. On the other hand, traders have been losing patience over the cryptocurrencyâ€™s continuous struggle with the \$86K resistance. Even in the past day, Bitcoin tested the \$85K level but failed to hold prices. However, analysts expect that if it surpasses the resistance, there are chances of upward movements. Will Bitcoin Advance to \$90K on Tackling \$86K? Prominent market analyst Ali posted a prediction on X recently. He says that on the weekly chart BTC shows a buy signal. This he stated is resultant from expecting a sustained close of the TD sequential indicator near \$86K. This could then open gates for \$90K and possibly even \$95K. On turning to its technical indicators, Bitcoin shows mixed signals. Its Moving Average Convergence Divergence (MACD) MACD line stands below the signal line indicating the overall bearish trend. However, its RSI value stands at 51.65 as per TradingView data. This suggests that the market sentiment and investors hold a somewhat positive attitude toward the cryptocurrency. As predicted by Ali, if Bitcoin overpowers the bears at \$86,000 it might reestablish the bullish trend. Meanwhile, other altcoins such as Raydium have shown significant upward movements in the last 24 hours.

- Corporate holdings of Bitcoin reached 688,000, or around 3.3% of the total supply, as a result. - The number of corporations investing in Bitcoin increased by 18% in the first quarter of 2025. In the first quarter of 2025, public corporations acquired a record-breaking 95,431 BTC, according to asset management Bitwiseâ€™s report on April 14. Corporate holdings of Bitcoin reached 688,000, or around 3.3% of the total supply, as a result. The preceding quarter was also a significant one for Bitcoin accumulation, so this is an increase of 16% from that. The number of corporations investing in Bitcoin increased by 18% in the first quarter of 2025, with 12 new firms joining the ranks of the 79 existing corporate BTC investors. Banking on Bitcoin With 531,644 BTC after its most recent acquisition of 3,459 BTC for \$286 million on April 14, MicroStrategy maintains a commanding lead. Approximately 77% of the asset value that firms have acquired falls into this category. At an average price of \$67,556 per BTC, the business announced that it had bought the asset worth \$36 billion. As of March 31, Bitwise reported that MARA Holdings was the second largest corporation, with 47,531 BTC, or approximately 7% of the total. The third-and fourth-largest Bitcoin mining businesses, in terms of total corporate BTC holdings, were Riot Platforms (2.8% share) and Cleanspark (1.7%). Additionally, on April 14, the Japanese Bitcoin investment company Metaplanet purchased 319 BTC, or around \$26 million, at a discount. The company is Asiaâ€™s biggest Bitcoin holder, while owning less than 1% of all corporate Bitcoins. The asset had fallen 24% from its all-time high on January 20th to close the three months period at \$82,350, making the big purchasing quarter that much more impressive. Highlighted Crypto News Today:

- In order to make the cryptocurrency sales easier, CleanSpark has launched an institutional Bitcoin trading desk. - As mining stocks see widespread selloffs in the Q1 of 2025, the Bitcoin miner is

placing a focus on self-funding. On April 15, the US-based Bitcoin miner CleanSpark announced that it will begin selling a part of its monthly Bitcoin earnings in an effort to achieve financial independence. Also, as stated in the announcement, CleanSpark was able to get a \$200 million Bitcoin-backed credit facility by entering into a partnership with Coinbase Prime, the crypto exchange's institutional brokerage branch. According to CleanSpark CEO Zach Bradford: The company has "achieved escape velocity" the ability to self-fund operations, augment our Bitcoin treasury, and contribute to expansion capital through operational cash flow thanks to the credit line and Bitcoin sales.

Placing Focus on Self-funding In order to make the cryptocurrency sales easier, CleanSpark has launched an institutional Bitcoin trading desk, it said. As mining stocks see widespread selloffs in the Q1 of 2025, the Bitcoin miner is placing a focus on self-funding. Morningstar reports that the CoinShares Crypto Miners ETF (WGMI), a publicly listed fund that tracks a varied group of Bitcoin mining companies, has seen a 40% decline in value since the beginning of the year. In mid-2023, the company adopted an almost 100% hold policy. Now, according to Bradford, it's time to change that and use part of their monthly output to fund operations again. If Bitcoin miners' cost of capital rises due to falling stock prices, creditors may demand quicker payback of loans. Following US President Trump's announcement in April of intentions to impose massive tariffs on US imports, the pressure on mining equities intensified. Due to their reliance on specialized mining technology, which is often purchased from foreign manufacturers, US Bitcoin miners are particularly susceptible to trade disputes. In contrast to its competitors, CleanSpark will not have to depend on equity dilution to pay operational expenses. Or on increasing borrowing to grow its Bitcoin reserves, according to Bradford.

Highlighted Crypto News Today: Ethereum Shows Mixed Signals as Whale Interest Wanes: What's Next For ETH?

There are thousands of cryptocurrencies in the market today. Bitcoin (BTC) has been the leading token for a long time. Selling at \$88,430, it has increased in value by 23.85% in the past year, but recent technical signals have indicated a downward trend in value coupled with reduced market interaction. This forces investors to search for other interesting initiatives with great long-term returns on investment. Among these interesting initiatives are Cardano (ADA), Tron (TRX), Binance Coin (BNB), Rexas Finance (RXS), Solana (SOL), and Ripple (XRP). Rexas Finance (RXS) Rexas Finance is just a project aimed at revolutionizing the real-world asset (RWA) tokenization market. It is a platform through which illiquid assets such as property, corporate debt securities, and even artwork can be tokenized to the blockchain. As analysts dig deep to find the next Bitcoin, Rexas Finance stays on top. Its presale value skyrocketed by a significant 567% from \$0.03 to \$0.20, showing a massive interaction volume. Rexas Finance has also successfully sold 458,248,493 RXS tokens out of 1,000,000,000 available tokens and raised \$47,650,156, making it one of the best presales of the year. After the presale, RXS will be listed on June 19, 2025, at \$0.25. As the token launch date draws near, analysts are hopeful about its prospects and anticipate a 50,000% post-launch increase in RXS tokens. Such success in its presale phase alone grants Rexas Finance the highest possibility of overtaking BTC regarding wealth creation.

Solana (SOL) Solana is also in the race to replace Bitcoin, trading at \$141.77 with a market capitalization of \$72.5 billion. Having increased in value by approximately 15,935%, SOL has given users the luxury of high-performance transactions and low transaction fees. Technical signals indicate SOL has an RSI of 51.34 in the neutral zone with a positive Chaikin Money Flow (CMF) indicator, highlighting a significantly increased buying pressure. This has led analysts to predict a possible 367.7% ROI by December 2028.

Binance Coin (BNB) BNB has recently transformed into a more versatile asset by introducing cross-chain transactions and its role in decentralized finance. Technical analysis displays a bullish MACD crossover that may see BNB gain upward momentum. RSI, however, stands at 56.15, indicating a neutral position. BNB currently trades at \$635.93 with a market cap of \$90.6 billion. Its value has increased by an extraordinary 635,490% since its launch, which has led analysts to predict that it could rise to \$5217.5 in five years.

Ripple (XRP) Ripple (XRP), currently trading at \$2.46 with a market capitalization of \$143 billion, was hit with a lawsuit by the U.S. Securities and Exchange Commission (SEC), which shook the entire crypto community. However, the coin recovered approximately 32% over two weeks following the lawsuit's resolution. This reassures analysts of the coin's resilience to unstable market conditions. Technical indications point to a positive trend, with an RSI of 52.2 and notable support levels pointing to rising investor confidence driven by alliances with financial institutions hoping to use XRP's blockchain for cross-border payments. This causes experts to project a possible rise in value by December 2030 of 1064.6%.

Cardano (ADA) Cardano is also a top contender with the possibility to provide significant ROI. Currently trading at \$0.73 per token and a market capitalization of \$21.67 Billion, ADA has increased in value by approximately 3550% since its introduction. Technical signals indicate a bullish trend with a possible year-over-year return of 5%. The RSI of 48.19 is in the neutral zone, meaning more profits than losses. This chart behavior influences analysts' predictions that Cardano (ADA) will be somewhere around \$1.5 in 2026.

Tron (TRX) Similar to Solana, TRON can be used to execute DeFi applications like smart contracts. With a market cap of \$21.65 billion, sold at \$0.22 per token, Tron has had a substantial price increase of 11,984%. The technical signal for TRX indicates a bullish outlook. At 47.19, the Relative Strength Index (RSI) indicates that the asset is in the neutral zone. Furthermore, the MACD value of 0.001 bolsters a positive view. Signals predict a possible increase of about 53.33% in a few months, supported by the success of TRON's focus on decentralizing the internet for sharing content without intermediaries.

Conclusion For those seeking the next Bitcoin-like opportunity, these cryptocurrencies offer compelling cases for long-term investments, with Rexas Finance standing out as the most promising alternative to Bitcoin. For more information about Rexas Finance (RXS) visit the links below: - Website: <https://rexas.com> - Win \$1 Million Giveaway: <https://bit.ly/Rexas1M> - Whitepaper: <https://rexas.com/rexas-whitepaper.pdf> - Twitter/X: <https://x.com/rexasfinance> - Telegram: <https://t.me/rexasfinance>

- Bitcoin is testing key resistance levels at the 50 and 200-day EMAs, signaling potential breakout. - A whale withdrew 1,500 BTC (\$128 million) from OKX, impacting liquidity as Bitcoin gained momentum. Bitcoin, the world's first and leading cryptocurrency by market cap, has been recording an uptrend after a reclaim from last week's low of \$74K range. Over time, Bitcoin has struggled to invite bulls, with the current trend showing a positive momentum. Tracking the market performance, it is notable that BTC trades at a price value of \$85,502, recording an uptick of 1.33% in just 24 hours. Notably, the market cap now reads at \$1.69T, up by a similar percentage recorded in its price value adjustments. However, Bitcoin's daily trading volume has recorded a dip, down by 1.44%, amounting to \$29.36 billion. The current trajectory is under the watch of market analysts eyeing whether the bullish move will continue or a reversal will be invited. Bitcoin Technical Analysis: Can BTC's EMA Test Lead to Upside? According to an observation by Lark Davis, it is notable that Bitcoin has made another attempt at a key trendline level. The price is approaching resistance formed by the 50 and 200-day EMAs (Exponential Moving Averages) with an ongoing consolidation above these EMAs, signaling potential move toward a breakout. The MACD (Moving Average Convergence Divergence) has shown a shift in direction suggesting increased bullish pressure. The histogram reveals a growing positive momentum, confirming the shift in the market's dynamics. Bitcoin's price action has been moving within a narrow range, with the 50-day EMA acting as immediate support and the 200-day EMA above. A sustained break above the trendline and 200-day EMA could signal further upside potential in the short term. BTC Whale Transaction and Current Market Performance The ongoing bullish movement comes at times when the transaction is at a spree. According to Arkham's report, the whale portfolio that held 1.5K BTC holdings, valued at \$128.26 million, released the assets with a price of \$85,509 per BTC. This reflects a 1.32% increase in value. Over the past 20 hours from the time of transaction, a whale withdrew 1,500 BTC from OKX, worth approximately \$128 million. A whale withdrew 1,500 \$BTC(\$128M) from #OKX in the past 20 hours.<https://t.co/SwGkjL4fKr> pic.twitter.com/xWFBxM0v27 - Lookonchain (@lookonchain) April 15, 2025 At the time of press, CoinMarketCap data indicates that Bitcoin's price is currently \$85,502.71, reflecting a 1.33% increase in the past 24 hours. Market capitalization is \$1.69 trillion while the fully diluted volume sits at \$1.79 trillion. The price chart shows a steady price rise throughout the day, with minor fluctuations, indicating positive market momentum. The recent movement is noteworthy as Bitcoin tries to establish a clear direction after previous volatility in the market.

- This expansion represents more than just technical growth for P2P.org - it signals a fundamental shift. - Through this network, users can stake both Bitcoin and BABY - the native token of Babylon - and earn rewards for securing the system. In a landmark move for the crypto industry, P2P.org - a global leader in validator infrastructure - has announced its full-scale validator support for Babylon Genesis, the world's first Bitcoin-Secured Network. This expansion represents more than just technical growth for P2P.org - it signals a fundamental shift in how Bitcoin can participate in the proof-of-stake (PoS) world without altering its core consensus mechanism. Bringing Bitcoin into the Staking Era Bitcoin has long been hailed as the gold standard of decentralization and security. However, it has remained outside the growing PoS ecosystem - until now. Babylon, an innovative blockchain protocol, bridges the gap by enabling Bitcoin staking while preserving the network's proof-of-work integrity. At the heart of this new ecosystem is Babylon Genesis, a standalone Layer 1 network that acts as both a control plane and liquidity hub for other Bitcoin-Secured Networks (BSNs). Through this network, users can stake both Bitcoin and BABY - the native token of Babylon - and earn rewards for securing the system. By joining the Genesis validator set, P2P.org reinforces its commitment to Bitcoin's evolution and brings its robust infrastructure, slashing protection, and institutional-grade service to this revolutionary protocol. Understanding Babylon: A Two-Pronged Innovation Babylon's architecture is built on two primary products, each designed to enhance Bitcoin's utility while maintaining its foundational ethos: 1. Babylon Bitcoin Staking Protocol This protocol allows BTC holders to stake their coins without transferring ownership or changing Bitcoin's core mechanics. BTC is delegated to Finality Providers, who secure emerging BSNs. In return, stakers earn native tokens like BABY, opening the door to yield generation for long-term Bitcoin holders. 2. Babylon Genesis - Genesis is the first network to leverage Babylon's staking protocol for real-world utility. It serves three critical roles: - Security Layer: Using Bitcoin staking and timestamping to anchor itself to the most secure blockchain. - Control Plane: Coordinating security across future BSNs. - Liquidity Hub: Facilitating capital flows through secure on-chain applications. This layered functionality ensures Babylon Genesis isn't just another blockchain - it's an infrastructure layer for the next generation of Bitcoin-based DeFi. Introducing the BABY Token Central to Babylon's economic design is the BABY token, engineered to align incentives across the ecosystem. With a fixed supply of 10 billion tokens, BABY supports network operations, governance, and security. Key Utilities of BABY: - Staking Rewards: Token holders earn yield by delegating to validators like P2P.org. - Governance: Vote on proposals, protocol upgrades, and fund allocation. - Network Fees: Used to pay for transactions and smart contract execution. - Security Collateral: Validators must stake BABY to operate. - BTC Staking Integration: BTC stakers receive BABY rewards, increasing demand for the token. The current annual inflation rate is 8%, evenly split between BABY and Bitcoin stakers, ensuring both groups are incentivized to secure the network. P2P.org's Validator Support: Enterprise-Grade Staking, Now for Bitcoin As one of the top three validator providers globally, P2P.org brings its proven staking expertise to Babylon Genesis. Their validator infrastructure offers: - High uptime and reliability - Security protections with slashing mitigation - Transparent reward distribution - User-friendly guides and dedicated support Bitcoin Staking - No Longer a Dream Until now, Bitcoin holders lacked a secure, non-custodial way to earn passive income. Babylon solves this with its Bitcoin Staking Protocol, allowing BTC to be delegated to

Finality Providers like P2P.org. Key Staking Details: - Unbonding Period: 1 week (1,008 BTC blocks) - Slashing Ratio: Minimal at 0.1%, preserving capital - Inflation Distribution: 4% of BABY supply goes to BTC stakers - Rewards: Paid in BABY, creating a circular incentive model Currently, staking is being rolled out in phases. From April 10th, only CAP1 participants (~1,000 BTC) can stake. Open staking for CAP2, CAP3, and new users will begin on April 24. Why Babylon Matters The launch of Babylon Genesis isn't just about staking—it's a philosophical milestone. It proves that Bitcoin, often critiqued for being static, can evolve without sacrificing its decentralization. By merging Bitcoin's security with PoS dynamics, Babylon opens up a universe of possibilities for applications, liquidity, and financial products. Babylon Phase 2 Highlights: - Dual-layer security with CometBFT validators and Bitcoin Finality Providers - Fast BABY unbonding time (about 50 hours vs Cosmos' 21 days) - Streamlined BTC integration with low fees and short lockups - Infrastructure built to onboard BSNs with minimal integration - This is the launchpad for a new wave of Bitcoin-native DeFi protocols. What's Next? The journey doesn't end here. Babylon Phase 3 will bring even greater interoperability, allowing other PoS networks to tap into Bitcoin security and liquidity via Babylon Genesis. P2P.org is already preparing to scale alongside this growth, continuing to offer validator services that empower users to maximize returns safely. How to Stake Whether you're staking BABY or BTC, P2P.org has made the process simple: For BABY Token Holders: - Visit the Babylon Staking Dashboard - Select P2P.org as your validator - Delegate your BABY and start earning rewards For BTC Holders: - Register your BTC through the Babylon dashboard - Choose P2P.org as your Finality Provider - Begin staking and earning BABY rewards With full documentation, even first-time stakers can navigate the process easily. Conclusion Babylon Genesis and its partnership with P2P.org mark a bold new era for Bitcoin. No longer confined to passive storage, BTC now plays an active role in securing decentralized networks, earning yield in a non-custodial, decentralized manner. As crypto matures, protocols like Babylon and infrastructure providers like P2P.org are ensuring that innovation doesn't compromise security, usability, or decentralization. With staking open and rewards live, the future of Bitcoin staking has officially arrived. You can find more details on Babylon Phase 2 [here](#).

- Metaplent purchased an additional 319 Bitcoins earlier today. - Japan Microstrategy is now the tenth-largest Bitcoin holder. The crypto market continues to experience global macroeconomic uncertainties. Bitcoin and Ether continue their uncertain price movements, with no significant price surges. Meanwhile, Metaplent purchased additional Bitcoins today and became one of the largest Bitcoin holders. Metaplanet announced its latest purchase of 319 BTC on its official X account earlier today. It made this purchase at an average price of 11,845,786 yen, i.e., \$83,147, increasing its total Bitcoin holdings to 4,525 Bitcoin. The company is known as Japanese Microstrategy due to its unwavering commitment to purchasing Bitcoins. Its latest Bitcoin purchase, worth \$13.3 million, took place on April 2, increasing its holdings to 4,206 BTC. Metaplanet: 10th Largest Bitcoin Holder Metaplanet finally made a place in the top 10 Bitcoin holders in the world. It acquired the 10th top Bitcoin holder position with today's Bitcoin purchase, as per BitcoinTreasuries.net. US Microstrategy holds a large amount of Bitcoins, 528,185 BTC, and it is the first global firm to hold Bitcoins of more than half a million. MARA and Riot Platforms acquired the top 2nd and 3rd positions with 47,600 BTC and 19,223 BTC holdings. Galaxy Digital Holdings, Tesla, Coinbase Global, and Block are some of the noteworthy firms that hold a large amount of Bitcoin. CleanSpark and Hut 8 Mining Corp are also present in the list of the top 10 Bitcoin holders in the world based on their BTC holdings. Metaplanet is firmly sticking to its Bitcoin acquisition strategy no matter the market conditions. It recently appointed Eric Trump as a member of its advisory board to reaffirm and accelerate the firm's vision of becoming the world's leading Bitcoin Treasury company. Highlighted Crypto News Today: Vitalik Buterin Calls for Strong Social Values at App Layer

- Robert Kiyosaki, in his most recent X post, expressed concern about an imminent economic downturn. - The author suggests diversifying holdings into Bitcoin, gold, and silver. The famous author of "Rich Dad Poor Dad," Robert Kiyosaki, has expressed severe concern about the impending economic collapse and the dollar's impending depreciation. In light of all this uncertainty, the American businessman suggests that people protect themselves from the economic catastrophe by investing in Bitcoin, gold, and silver. Robert Kiyosaki, in his most recent X post, expressed concern about an imminent economic downturn and the dollar's precarious situation. "That giant crash has arrived," he said, reiterating his earlier claims about the "biggest stock and bond market crash in history." Worst Economic Downturn Warning Robert Kiyosaki suggests diversifying holdings into Bitcoin, gold, and silver to stave against the impending economic collapse. The author speculated that the world's new elite and wealthy would emerge from this premeditated disaster if they acted quickly to amass physical gold, silver, and Bitcoin. Moreover, the author claims that the worst economic downturn in history has already started. Stock and bond markets' recent declines in response to US President Trump's tariff decision lend credence to his claim. In the first week of April, the stock market had its worst decline since 2020. By pointing out the high degree of connection between Bitcoin and the stock market, analysts foretold a temporary correction for Bitcoin. Moreover, Bitcoin (BTC) fell to a four-month low of \$74,000 the next day, despite the fact that it remained impervious to the larger bearish trends on the previous day. Even though Bitcoin's price dropped for a little while, it quickly recovered and surged again the next day. Robert Kiyosaki's optimistic position on Bitcoin is further strengthened by this unexpected Bitcoin revival. The value of the US dollar is being threatened, according to Robert Kiyosaki, who added new insights to his analysis.

MicroStrategy appears to restart its Bitcoin buying spree, following a strategic lull in early April. CEO Michael Saylor's recent X post in which he shared his company's tracker chart of its Bitcoin holdings and cheekily titled it "No tariffs on Orange Dots." Which has fueled fresh rumors of an imminent Michael Saylor Bitcoin buy. Saylor's orange dots on his chart have traditionally denoted new BTC buys, so his post is a possible tease at new accumulation. The company now holds 528,185 BTC,

which is approximately valued at \$44.7 billion. That would be MicroStrategy's initial Q2 purchase since its gargantuan \$2 billion acquisition on March 31. Which placed its holdings at close to 530,000 BTC. Previously, Saylor's declarations of the company's holdings preceded real purchases, sending Bitcoin's price temporarily soaring. After his latest declaration, BTC briefly shot over \$83,000 and now trades at \$84,762. Despite market euphoria, there are still some nervous analysts. Crypto analyst Joao Wedson warned that Bitcoin can still drop to \$65,000, referencing strong support levels like the True Market Mean Price and Alpha Price. A drop to that level would severely hurt MicroStrategy, given its average cost of buying \$67,458 per BTC. Analyst also indicated that a steep fall would compel the company to sell MSTR shares to avoid liquidation. However, Saylor remains unfazed. Characterizing Bitcoin as "driven by chaos," he remains a BTC proponent in the midst of macroeconomic instability, like escalating US-China trade tensions. While MicroStrategy's stock has had recent volatility soaring 10% on Friday before falling 0.69% in after-hours trading the company's long-term strategy for Bitcoin is not affected. Whether this move ignites another rally or tests MicroStrategy's trust in crypto. One thing is for sure: Saylor's orange dots have once again captured the market's attention. Highlighted Crypto News Today MANTRA Token Wiped Out Over \$5B in 24 Hours, Liquidations to Blame?

- Bullish BCH price prediction for 2025 is \$650 to \$1467.8. - Bitcoin Cash (BCH) price might reach \$1500 soon. - Bearish BCH price prediction for 2025 is \$149.1. In this Bitcoin Cash (BCH) price prediction 2025, 2026-2030, we will analyze the price patterns of BCH by using accurate trader-friendly technical analysis indicators and predict the future movement of the cryptocurrency. TABLE OF CONTENTS | INTRODUCTION | | BITCOIN CASH (BCH) PRICE PREDICTION 2025 | | | BITCOIN CASH (BCH) PRICE PREDICTION 2026, 2027-2030 | | CONCLUSION | | FAQ | Bitcoin Cash (BCH) Current Market Status | Current Price | \$341.37 | 24 " Hour Price Change | 0.76% Up | | 24 " Hour Trading Volume | \$361.13M | | Market Cap | \$6.77B | | Circulating Supply | 19.85M BCH | All " Time High | \$4,355.62 (On Dec 20, 2017) | | All " Time Low | \$75.08 (On Dec 15, 2018) | What is Bitcoin Cash (BCH) | TICKER | BCH | | BLOCKCHAIN | Bitcoin Cash | | CATEGORY | Altcoin | | LAUNCHED ON | August 2017 | | UTILITIES | Governance, security, gas fees & rewards | Bitcoin Cash is a peer-to-peer electronic money system that aims to become a trusted global currency with fast payments, micro-commissions, privacy, and high transaction capacity. Just as physical money, such as dollar bills, is transferred directly to the recipient, BitcoinCash payments are sent directly from person to person. Bitcoin Cash (BCH) is a form of cryptocurrency very similar to Bitcoin. In fact, Bitcoin Cash is a fork of Bitcoin due to the split of the chain where a certain group of Bitcoin developers is not satisfied with the general direction of Bitcoin's scalability. Bitcoin Cash 24H Technicals (Source: TradingView) Bitcoin Cash (BCH) Price Prediction 2025 Bitcoin Cash (BCH) ranks 19th on CoinMarketCap in terms of its market capitalization. The overview of the Bitcoin Cash price prediction for 2025 is explained below with a daily time frame. BCH/USDT Horizontal Channel Pattern (Source: TradingView) In the above chart, Bitcoin Cash (BCH) laid out a Horizontal Channel pattern. A horizontal channel or sideways trend has the appearance of a rectangle pattern. It consists of at least four contract points. This is because it needs at least two lows to connect, as well as two highs. Horizontal channels provide a clear and systematic way to trade by providing buy and sell points. The longer the horizontal channel, the stronger the exit movement will be. There is frequently a price on the channel after exit. The exit often occurs at the fourth contact point on one of the horizontal channel's lines. At the time of analysis, the price of Bitcoin Cash (BCH) was recorded at \$341.37. If the pattern trend continues, then the price of BCH might reach the resistance levels of \$377.7 and \$527.1. If the trend reverses, then the price of BCH may fall to the support of \$320.5 and \$270.7. Bitcoin Cash (BCH) Resistance and Support Levels The chart given below elucidates the possible resistance and support levels of Bitcoin Cash (BCH) in 2025. BCH/USDT Resistance and Support Levels (Source: TradingView) From the above chart, we can analyze and identify the following as the resistance and support levels of Bitcoin Cash (BCH) for 2025. | Resistance Level 1 | \$650 | | Resistance Level 2 | \$1467.8 | | Support Level 1 | \$278.9 | | Support Level 2 | \$149.1 | BCH Resistance & Support Levels Bitcoin Cash (BCH) Price Prediction 2025 " RVOL, MA, and RSI The technical analysis indicators such as Relative Volume (RVOL), Moving Average (MA), and Relative Strength Index (RSI) of Bitcoin Cash (BCH) are shown in the chart below. BCH/USDT RVOL, MA, RSI (Source: TradingView) From the readings on the chart above, we can make the following inferences regarding the current Bitcoin Cash (BCH) market in 2025. | INDICATOR | PURPOSE | READING | INFERENCE | | 50-Day Moving Average (50MA) | Nature of the current trend by comparing the average price over 50 days | 50 MA = \$324 Price = \$343.7 (50MA < Price) | Bullish/Uptrend | | Relative Strength Index (RSI) | Magnitude of price change; Analyzing oversold & overbought conditions | 59.5 < 30 = Oversold 50-70 = Neutral > 70 = Overbought | Neutral | | Relative Volume (RVOL) | Asset's trading volume in relation to its recent average volumes | Below cutoff line | Weak Volume | Bitcoin Cash (BCH) Price Prediction 2025 " ADX, RVI In the below chart, we analyze the strength and volatility of Bitcoin Cash (BCH) using the following technical analysis indicators " Average Directional Index (ADX) and Relative Volatility Index (RVI). BCH/USDT ADX, RVI (Source: TradingView) From the readings on the chart above, we can make the following inferences regarding the price momentum of Bitcoin Cash (BCH). | INDICATOR | PURPOSE | READING | INFERENCE | | Average Directional Index (ADX) | Strength of the trend momentum | 23.7 | Strong Trend | | Relative Volatility Index (RVI) | Volatility over a specific period | 63.14 < 50 = Low > 50 = High | High Volatility | Comparison of BCH with BTC, ETH Let us now compare the price movements of Bitcoin Cash (BCH) with that of Bitcoin (BTC), and Ethereum (ETH). BTC Vs ETH Vs BCH Price Comparison (Source: TradingView) From the above chart, we can interpret that the price action of BCH is similar to that of BTC and ETH. That is, when the price of BTC and ETH increases or decreases, the price of BCH also increases or decreases respectively. Bitcoin Cash (BCH) Price Prediction 2026, 2027 " 2030 With the help of the aforementioned technical analysis indicators and trend patterns, let us predict the price of Bitcoin Cash (BCH) between 2026, 2027, 2028, 2029, and 2030. | Year | Bullish Price | Bearish Price | | Bitcoin Cash (BCH) Price Prediction 2026 | \$2000 | \$130 | | Bitcoin Cash (BCH) Price Prediction 2027 | \$2500 | \$120 | | Bitcoin Cash (BCH) Price Prediction 2028 | \$3000 |

\$110 | | Bitcoin Cash (BCH) Price Prediction 2029 | \$3500 | \$100 | | Bitcoin Cash (BCH) Price Prediction 2030 | \$4000 | \$90 | Conclusion If Bitcoin Cash (BCH) establishes itself as a good investment in 2025, this year would be favorable to the cryptocurrency. In conclusion, the bullish Bitcoin Cash (BCH) price prediction for 2025 is \$1467.8. Comparatively, the bearish Bitcoin Cash (BCH) price prediction for 2025 is \$149.1. If there is a positive elevation in the market momentum and investors' sentiment, then Bitcoin Cash (BCH) might hit \$1500. Furthermore, with future upgrades and advancements in the Bitcoin Cash ecosystem, BCH might surpass its current all-time high (ATH) of \$4,355.62 and mark its new ATH. FAQ 1. What is Bitcoin Cash (BCH)? Bitcoin Cash is a peer-to-peer electronic money system that aims to become a trusted global currency with fast payments, micro-commissions, privacy, and high transaction capacity. 2. Where can you buy Bitcoin Cash (BCH)? Bitcoin Cash (BCH) has been listed on many crypto exchanges which include Binance, BlueBit, OKX, Bybit, Zedcx Exchange, and more. 3. Will Bitcoin Cash (BCH) record a new ATH soon? With the ongoing developments and upgrades within the Bitcoin Cash platform, Bitcoin Cash (BCH) has a high possibility of reaching its ATH soon. 4. What is the current all-time high (ATH) of Bitcoin Cash (BCH)? Bitcoin Cash (BCH) hit its current all-time high (ATH) of \$4,355.62 on Dec 20, 2017. 5. What is the lowest price of Bitcoin Cash (BCH)? According to CoinMarketCap, BCH hit its all-time low (ATL) of \$75.08 on Dec 15, 2018. 6. Will Bitcoin Cash (BCH) hit \$1500? If Bitcoin Cash (BCH) becomes one of the active cryptocurrencies that majorly maintain a bullish trend, it might rally to hit \$1500 soon. 7. What will be the Bitcoin Cash (BCH) price by 2026? Bitcoin Cash (BCH) price might reach \$2000 by 2026. 8. What will be the Bitcoin Cash (BCH) price by 2027? Bitcoin Cash (BCH) price might reach \$2500 by 2027. 9. What will be the Bitcoin Cash (BCH) price by 2028? Bitcoin Cash (BCH) price might reach \$3000 by 2028. 10. What will be the Bitcoin Cash (BCH) price by 2029? Bitcoin Cash (BCH) price might reach \$3500 by 2029. ETH and BTC rule the market right now as the largest cryptos. However, other cryptocurrencies have replicated their achievements over time. This year, five altcoins might replace Ethereum and Bitcoin. Their strong fundamentals and bullish momentum drive their ability to yield returns similar to ETH and BTC's. Among these, Rexas Finance (RXS) stands out due to its unique approach to real-world asset tokenization. Though a newcomer, experts think it could be among the best performers in this cycle. Rexas Finance (RXS) Rexas Finance is well-positioned to thrive in the real-world asset (RWA) tokenization sector, which is expected to grow to \$16 trillion by 2030. Rexas Finance turns physical assets like real estate and fine art into digital tokens. Through this tokenization process, Rexas Finance is unlocking investment opportunities that were once out of reach to regular investors. One of the biggest catalysts for RXS is its upcoming official token launch on June 19. The presale has already been a massive success, raising over \$47.5 million and selling 457 million tokens. With this level of demand before even hitting the broader market, analysts predict a major surge in value post-launch. RXS has already shown its potential, surging 566% since the presale began. This momentum shows strong investor confidence and highlights the massive upside still ahead. Demand is expected to skyrocket as the token lists on top-tier exchanges. Hence, explosive price growth could be seen in the coming months. Rexas Finance boasts a powerful ecosystem that sets it apart. The Rexas Token Builder is an easy-to-use tool for creating digital tokens. The QuickMint Bot allows users to create and deploy tokens quickly via Telegram and Discord. Meanwhile, the Rexas Estate is a dedicated platform for fractional real estate investments. Tokenomics is crucial in price sustainability, boosting Rexas Finance's long-term growth potential. Because of its limited supply, scarcity will naturally drive up the token's value. Rexas Finance's ecosystem and promising role in real-world asset tokenization give it an edge in the market. Institutional interest could rise, making RXS a top altcoin to buy, as RWA tokenization has been marked as one of the most promising sectors in crypto this year. Analysts believe RXS could reach \$10 quickly and eventually rocket about 100x within twelve months. If its presale momentum continues, RXS could deliver the predicted ROI. Ondo Finance (ONDO) Ondo Finance is making waves in the real-world asset (RWA) space. Recently, crypto whales bought 1.08 million ONDO tokens in just a week. This growing demand could push ONDO's price toward \$0.95, up from its current \$0.8. Ondo's tokenized treasury assets, OUSG and USDY, recently crossed \$1 billion. This milestone proves the strong appetite for RWAs in digital finance. With the tokenized Treasuries market hitting an all-time high of \$4.6 billion, Ondo is well-positioned for future growth. Its ability to bridge DeFi and traditional finance makes it a strong contender for investors seeking stability and yield. Uniswap (UNI) UNI is gaining significant attention from crypto whales, with large holders' netflow surging over 3900% in a week. This signals strong accumulation. It has also reduced supply and could drive UNI's price higher. Riding the crypto market rebound, UNI recently broke key resistance levels. It surged over 8% to \$7.04. Indicators like MACD and Chaikin Money Flow suggest continued upward movement. Targets are at \$8 or higher. As demand for decentralized exchanges grows, Uniswap remains a top pick for investors eyeing long-term gains in DeFi. Hyperliquid (HYPE) HYPE has been recovering strongly, gaining 35% in just ten days after rebounding from \$12. Currently trading around \$16, it's eyeing the \$18.5-\$20 resistance zone. Technical indicators signal bullish momentum. For example, traders are growing confident as Open Interest surged by \$44 million. If HYPE breaks \$16.50, it could push toward \$19.16 and even \$21. However, a failure to clear resistance may send it back to \$13.44. With growing interest and improving market sentiment, Hyperliquid remains a solid investment this year. Tron (TRX) Tron is gaining traction as one of the most profitable blockchains, handling billions in Tether (USDT) transactions daily. Crypto analyst Javon Marks predicts a 516% price surge to \$1.11m. Founder Justin Sun's expansion of meme coins and planned integration with Solana further boost its appeal. With over 3 million active accounts and strong profitability, TRX is a top altcoin to buy. Conclusion Each of the five mentioned altcoins offers unique advantages that position them as the next Ethereum and Bitcoin. If the narrative sustains, they could be the best

investment choices for the year. However, Rexas Finance stands out as the strongest contender. With an upcoming token launch and a rapidly expanding ecosystem, RXS has the potential for exponential growth. Following its presale momentum, analysts believe Rexas Finance is the best investment to make right now. For more information about Rexas Finance (RXS) visit the links below: - Website: <https://rexas.com> - Win \$1 Million Giveaway: <https://bit.ly/Rexas1M> - Whitepaper: <https://rexas.com/rexas-whitepaper.pdf> - Twitter/X: <https://x.com/rexasfinance> - Telegram: <https://t.me/rexasfinance> Disclaimer: TheNewsCrypto does not endorse any content on this page. - Bitcoin (BTC) trades at \$84,457.07 with a \$1.67T market cap after reclaiming \$86K. - RSI near 60 and CMF at 0.02 reflect a neutral to bullish market structure. Bitcoin rebounded to \$86,015.19 in the past 24 hours before settling at \$84,457.07. This reflects a modest daily gain of 0.89%. Its market capitalization rose to \$1.67 trillion, advancing in lockstep with price growth. However, the daily trading volume dropped 23.19% to \$28.37 billion. The market cap ratio now stands at 1.69%, suggesting reduced immediate momentum despite bullish undertones. Bitcoin's circulating and total supply both rest at 19.85 million BTC, just short of the 21 million maximum. Meanwhile, the global crypto market cap rose 1.27% to \$2.68 trillion. Yet, overall 24-hour volume fell by 9.14%, narrowing the immediate liquidity window. The U.S. may soon declare Bitcoin a national strategic asset. This shift could redefine its role in global finance. New Hampshire aims to allocate up to 10% of state funds to Bitcoin. Arizona's Senate is debating legislation supporting home-based Bitcoin activities and a state Bitcoin reserve. Sweden is evaluating similar strategic reserves to enhance financial resilience. Is Institutional Interest Enough to Fuel the Next BTC Rally? Technically, Bitcoin faces visible resistance around \$86,000. A sustained break above this could propel prices toward the \$88,000-\$90,000 corridor. Meanwhile, support holds at \$81,000. If breached, prices might slide toward \$78,500, which marks a secondary cushion. From the attached chart, the RSI currently reads 59.86, hovering just below the overbought threshold. Its alignment with the RSI average of 59.85 indicates stability rather than excessive momentum. The CMF (Chaikin Money Flow) stands marginally positive at 0.02. This implies slight accumulation but lacks aggressive capital inflow. The price sits above the 20-period moving average, validating a near-term bullish stance. Moving average crossovers confirm this trend. The recent bullish crossover suggests continuation, as short-term averages rise above long-term baselines. While trading activity has thinned, institutional interest remains. Regulatory signals from U.S. states and Sweden inject fresh strategic narrative. If policy traction continues, Bitcoin's adoption as a reserve or sovereign hedge could accelerate. A clear break above \$86,000 may unlock higher targets. Highlighted Crypto News Today Helium Breaks \$3 Resistance, Eyes \$5 Milestone This April

Market volatility has many traders searching for projects that could shine despite negative sentiment. Four coins stand out as top crypto picks worth noting: BlockDAG (BDAG), Bitcoin (BTC), Ripple (XRP), and Tron (TRX). Each delivers a different angle, whether it's transactional speed, cross-border payments, or decentralized applications. Investors appreciate tried-and-true networks like Bitcoin alongside newer concepts such as BlockDAG's advanced architecture. Some see regulation as a hurdle, others view it as validation, but all four coins enjoy strong support and growing communities. No single crypto solves every challenge, yet these options resonate with those who anticipate a market rebound. 1. BlockDAG (BDAG): The Parallel Chain Game-Changer BlockDAG (BDAG) has captured attention as one of the top crypto picks, thanks to its directed acyclic graph (DAG) structure designed for processing transactions in parallel. This technology streamlines throughput and reduces congestion, making BlockDAG appealing for a wide range of decentralized applications. The network's presale has raised over \$213.5 million, with 19.1 billion coins sold. BDAG's price now sits at \$0.0248 in batch 27, while early holders have already witnessed gains of 2,380% thus far. A mainnet launch is expected later this year, which is set to spur further expansion. BlockDAG's X1 Miner App also recently hit one million users, a significant milestone that underlines growing community support. Enthusiasts now cite the project's DAG-based architecture as a key edge, especially for applications requiring swift confirmations. 10 Upcoming listings on centralized exchanges will further open doors to new buyers and liquidity, potentially boosting long-term growth. Wider adoption is expected as BlockDAG continues to deliver on its promise of scalable and secure infrastructure. Its presale performance already demonstrates market enthusiasm, and many believe this momentum will likely continue, potentially bringing major upsides for holders down the road. 2. Bitcoin (BTC): The Steadfast Heavyweight Bitcoin (BTC) remains one of the top crypto picks for many traders, as it stands firmly in first place by market cap. It's recognized for pioneering decentralized finance, and its brand recognition still surpasses all competitors. Critics cite slower transaction times and higher fees compared to newer networks, yet Bitcoin's finite supply and widespread acceptance bolster its long-term appeal. The token has fluctuated between \$94,000 and \$87,000 in recent weeks, reflecting broader economic forces and changing investor moods. Some see these dips as prime buying opportunities, while others remain cautious. Nonetheless, Bitcoin's reputation and historical growth keep it at the forefront of many portfolios and trading strategies. 3. Ripple (XRP): The Cross-Border Payment Solution on the Rise Ripple (XRP) provides near-instant cross-border transactions at minimal cost, a proposition that draws international banks and payment services. Many rank XRP among the top crypto picks for 2025, pointing to its collaborations with traditional financial institutions. Some observers raise concerns over its ongoing regulatory challenges, noting that lawsuits have caused volatility in the past. Still, XRP's utility remains evident: millions of dollars move across its network every day, thanks to swift settlement times. Proponents believe a clearer regulatory framework could allow XRP to cement its position as a go-to transfer system. In a sea of digital assets vying for real-world usage, XRP's focus on practical payments keeps it relevant, even as the market sees ups and downs. 4. Tron (TRX):

Scaling the Content Economy Tron (TRX) remains one of the top crypto picks for developers interested in building decentralized platforms for things like entertainment and data sharing. The network's approach aims to reduce reliance on intermediaries, thereby granting content producers direct access to global audiences. Critics highlight occasional controversies surrounding Tron's leadership, as well as heightened competition from other smart contract chains. Meanwhile, advocates counter that Tron's rapid upgrades and extensive community support keep it an integral part of the blockchain conversation. Overall, Tron's steady progress suggests it may remain a compelling choice for those seeking simpler on-chain experiences. Looking Ahead: Which Coin Suits Your Strategy? The crypto market can be intimidating, but these four remain top crypto picks for varying reasons. Bitcoin's first-mover advantage and extensive liquidity resonate with long-term holders. XRP's quick, cost-effective remittances attract cross-border payment enthusiasts. Tron's content-focused model hooks developers and creators in search of a user-friendly network. But BlockDAG takes the crown for adaptability, offering fresh technology and strong presale crossing \$213.5 million. Anyone seeking a unique approach to scalability may want to follow BDAG's upcoming developments. A decisive entry could secure a position before further announcements drive momentum in 2025. - Lomond School will accept Bitcoin for tuition starting in Autumn 2025. - Bitcoin payments will convert to fiat immediately, with a BTC treasury possible later. Lomond School in Scotland will become the first educational institution in the UK to accept Bitcoin for tuition payments. The new policy begins in the Autumn semester of 2025. The move reflects the school's push to stay ahead in financial innovation and digital currency adoption. The school said it aims to prepare students for a volatile financial future. It plans to integrate "sound money principles" from the Austrian School of Economics into its curriculum. While Bitcoin will be accepted, other cryptocurrencies will not. All Bitcoin payments will be converted to fiat currency immediately. The school also emphasized Bitcoin's inclusivity. According to its announcement, Bitcoin is open to anyone and promotes financial access, especially in regions lacking traditional banking services. Lomond views this as an opportunity to teach ethics, technology, and financial literacy together. Bitcoin Gains Ground in Global Education Globally, more educational institutions are embracing Bitcoin both operationally and academically. In 2022, the University of Cincinnati launched courses on crypto and Web3 technologies. A year later, El Salvador incorporated Bitcoin education into its national curriculum through the Mi Primer Bitcoin initiative. In 2024, the University of Wyoming launched a Bitcoin Research Institute. The institute will focus on peer-reviewed studies of the digital asset. In early 2025, the University of Austin allocated \$5 million from its \$200 million endowment to Bitcoin investments. Chun Lai, the university's chief investment officer, said the fund aims to benefit from long-term digital asset growth. Institutions are increasingly viewing Bitcoin as a hedge against inflation and fiat currency devaluation. Meanwhile, Bitcoin adoption is growing in the U.S. at the state level. According to Bitcoin Law, 47 Bitcoin reserve bills have been introduced across 26 states. Out of those, 41 bills remain active. Highlighted Crypto News Today Sei Token Encounters 11% Single-Day Surge Post Trump's WorldFi Purchase

- Bitcoin has factored in a modest price increase of 3.31% in the last 24 hours. - The cryptocurrency has been struggling to break resistance at the \$80K range for several weeks. The crypto market pendulum has decided to swing towards the bullish end in the last 24 hours. Leading cryptocurrencies have begun to show a price recovery following a significant downfall. Meanwhile, while the Tariff war has paused, the crypto regulatory sector has sprung into action. Notably, in the last 24 hours, the largest cryptocurrency, Bitcoin has factored in a modest price increase of 3.31%. This has aided BTC to once again raise to the \$83,000 level after yesterday's brief visit to the \$80K support. Moreover, on Monday, for the first time in 2025, the digital asset fell to the \$70K level causing an uproar in the community. Although analysts had predicted it earlier, members still expressed FUD during the crash. Following this, over the past week, Bitcoin has regained its previous consolidation at the \$80K range. The cryptocurrency is currently struggling to break its \$83K resistance as depicted by its daily chart. BTC tested an intra-day high of \$84,067 before correcting to current levels. At the time of writing, Bitcoin was trading at \$83,314.01 as per CMC data. Will Bitcoin Cross \$90K Anytime Soon? On analyzing its technical indicators, Bitcoin shows positive signals. The Chaikin Money Flow (CMF) indicator value stands at 0.12. This suggests an increasing inflow of capital into the digital asset thus indicating positive movements in the coming days. Further confirming this statement, the RSI value stands at 59.40 as per TradingView data. This highlights a neutral market sentiment in the cryptocurrency. If Bitcoin prices in these positive signals, it can be expected to break the \$80K resistance and move upwards soon. However, market analyst Ali has identified a W channel pattern in Bitcoin's recent price movements. He predicts that this "W" could be followed by an "M" meaning two upward movements with a price plunge in the middle. Meanwhile, within the altcoin sector, tokens such as Magic Eden and JASMY showed significant upward movements in the last 24 hours.

- Florida's HB 487 passed its first committee with unanimous approval on April 10. - New Hampshire's HB 302 passed the House and now awaits Senate review. Florida has taken its first legislative step toward holding Bitcoin as a state reserve asset. On April 10, the House Insurance and Banking Subcommittee unanimously passed House Bill 487 (HB 487). This rare bipartisan support positions Florida alongside states like Arizona and New Hampshire in the Bitcoin reserve race. Titled "Investments of Public Funds in Bitcoin," HB 487 allows the Chief Financial Officer and State Board of Administration to invest up to 10% of select funds into Bitcoin. These funds include the General

Revenue Fund and the Budget Stabilization Fund. States Push Bitcoin Reserve Bills Forward Florida’s bill permits Bitcoin investments through direct purchases, qualified custodians, or regulated exchange-traded products. It also allows Bitcoin holdings to be loaned or included in ETFs. This flexibility aims to maximize returns while maintaining state ownership and security. The bill must now pass three more committees: Government Operations, Ways & Means, and Commerce. If it clears those, it will proceed to a full House vote. After that, the bill would move to the Senate and then to the governor’s desk. Meanwhile, New Hampshire’s House passed its bill, HB 302, with a narrow 192–179 vote on the same day. That bill also allows up to 10% of state funds to be invested in Bitcoin and precious metals. However, it includes strict eligibility rules. Only cryptocurrencies with a market cap over \$500 billion qualify. Currently, Bitcoin is the only asset that meets this threshold. HB 302 now heads to the New Hampshire Senate. If approved, it will require Governor Kelly Ayotte’s signature to become law. The bill also sets guidelines for custody, requiring state-held assets to be stored securely via custodians or exchange-traded products. Highlighted Crypto News Today Magic Eden Ignites Over 11%, But Is It Built to Last?

- Proposed by Bitcoin Policy Institute, Bitcoin Bonds are hybrid securities combining the features of both traditional bonds and cryptocurrency. Bitbonds tend to offer a 1% fixed yield plus Bitcoin price gains to fund projects and ease the U.S.’s elevated debt burden. - BitBonds allocate 90% of funds to government operations, with 10% buying Bitcoin; investors earn 1% annually and up to 4.5% compounded Bitcoin returns. - By driving Bitcoin demand and legitimizing crypto through government backing, BitBonds could boost prices despite tariff pressures, and reshape the post-tariff financial landscape. Background of Bitcoin Bonds Donald Trump’s aggressive tariff strategy has reverberated across the global economy, unleashing significant volatility in financial markets. As a high-risk asset, cryptocurrency has proven particularly vulnerable to these disruptions. Under the weight of Trump’s tariff policies, Bitcoin’s price plummeted to a low of approximately \$74,500 YTD on this Monday, April 7, 2025, reflecting the intense pressure felt by the crypto market. Amid this turmoil, the Federal Reserve has shown no inclination toward emergency interest rate cuts. High tariffs inevitably fuel inflation, as evidenced by rising data, making rate reductions an unlikely response given the Fed’s mandate. This dynamic suggests a looming bear market for cryptocurrencies in 2025. Yet, is such a downturn truly inevitable? A recent proposal from the Bitcoin Policy Institute, a U.S.-based nonprofit, offers a potential countermeasure: Bitcoin-enhanced Treasury bonds. While this concept lacks official U.S. government backing, it presents a compelling solution to the nation’s current economic challenges. Bitcoin Bonds could address the ballooning U.S. debt crisis while simultaneously injecting liquidity into the Bitcoin market without relying on Federal Reserve rate cuts. This article dives into why Bitcoin Bonds matter, what they are, their mechanics, and their potential to shape Bitcoin’s price in a post-tariff world. Why You Need to Pay Attention to Bitcoin Bonds? Bitcoin Bonds could redefine the financial landscape by linking government debt to cryptocurrency, with profound implications for Bitcoin’s future price movement. Here’s why they demand your attention: - Government Backing Boosts Bitcoin: If the U.S. issues Bitcoin Bonds, it would be a historic endorsement of cryptocurrency by a major government. This could legitimize Bitcoin globally, drawing in institutional investors and sparking widespread adoption—key drivers of price growth. - Massive Buying Power: Imagine \$1 trillion in Bitcoin Bonds issued, with 10% (\$100 billion) used to buy Bitcoin. Given Bitcoin’s market cap of around \$1 trillion, this influx could significantly increase demand, pushing prices upward. - A Price Amplification Loop: As government purchases drive Bitcoin’s price higher, Bitcoin Bonds become more attractive to investors, potentially leading to more bond issuance. This cycle could amplify Bitcoin’s value over time. Bitcoin Bonds aren’t just a fiscal tool—they could be a catalyst for Bitcoin’s next big rally, making them a critical development for investors and the crypto market alike. What Are Bitcoin Bonds? Bitcoin Bonds, or BitBonds, are hybrid debt securities that blend the stability of traditional bonds with the growth potential of Bitcoin (BTC). Issued by governments or corporations, BitBonds raise capital for projects while allocating a portion of the funds to purchase Bitcoin. Investors receive a fixed interest rate plus a share of Bitcoin’s price appreciation, making BitBonds an innovative bridge between conventional fixed-income investments and the volatile world of cryptocurrency. Unlike traditional bonds, which solely offer fixed returns, or direct Bitcoin investments, which expose holders to significant volatility, BitBonds combine both elements. This dual structure appeals to investors seeking predictable income alongside crypto exposure, without the complexities of managing digital assets. For issuers, BitBonds tap into the growing interest in cryptocurrency, broadening their investor base while aligning with modern financial trends. How Do Bitcoin Bonds Work? Issuance Process According to Bitcoin Policy Institute’s proposal, BitBonds will be issued by entities such as governments funding public infrastructure or corporations financing expansion. The issuance mirrors traditional bonds but introduces a cryptocurrency twist: a percentage of the proceeds is invested in Bitcoin, held securely for the bond’s term. Operational Mechanics Bitcoin Bonds operate through a structured process integrating debt and crypto: - Issuance: The Treasury sells bonds, raising funds like any bond sale. - Bitcoin Purchase: 10% of proceeds buy Bitcoin, held in a government-controlled wallet, with the remaining 90% used to fund government operations. - Interest Payments: Investors receive 1% annually (\$10 per \$1,000 bond). - Gain Distribution: Bitcoin appreciation is tracked; investors claim their gains up with excess retained by the government. The gains on Bitcoin appreciation are up to 4.5% compounded annually on the 10% allocation. Investment Allocation The allocation strategy is a key feature: - 90% of funds support the issuer’s projects—whether it’s building roads, renewable energy facilities, government operations, or corporate initiatives. - 10% of funds are used to buy Bitcoin, stored in a custodial wallet until maturity or a predefined redemption period. This split ensures the primary goal of capital raising is met while introducing Bitcoin’s upside potential. Returns Structure Investors benefit from two revenue streams: - Fixed Interest Rate: A steady annual return (e.g., 1% over 10 years) on the full investment, akin to traditional bonds. - Bitcoin Appreciation: A capped portion of Bitcoin’s price gains (e.g., up to 4.5% compounded

annually on the 10% allocation). Excess gains beyond the cap are typically split between investors and the issuer (e.g., 50/50). Source: Bitcoin Policy Institute Hypothetical Example Imagine a \$100 million BitBond: - \$90 million funds government operations. - \$10 million buys Bitcoin at \$50,000 (hypothetical) per BTC, acquiring 200 BTC. - Investors earn 1% annually (\$1 million) on the \$100 million. - If Bitcoin rises to \$100,000 by maturity, the \$10 million grows to \$20 million. Investors receive a capped return (e.g., \$14.5 million total), with the issuer and investors sharing the excess (\$5.5 million split). This example highlights BitBonds'™ balanced appeal: stability plus growth.

How Bitcoin Bonds Could Address the U.S. Debt Crisis: The Motive Behind Bitcoin Bonds

The U.S. government's potential interest in Bitcoin Bonds stems from pressing fiscal challenges. The U.S. national debt, with approximately \$9 trillion of federal debt maturing within the next twelve months, and over \$14 trillion within the next three years, presents a significant challenge for policymakers (Hohns & Pines, n.d.). Bitcoin Bonds combine the stability of Treasury Bonds with the potential of cryptocurrency. Here's how Bitcoin Bonds may resolve the U.S. debt dilemma:

Reducing Borrowing Rates on Debt

Offering a 1% interest rate—below typical Treasury yields—Bitcoin Bonds could lower overall borrowing costs. This could save billions annually for the U.S. government, easing the debt burden by lowering the government's borrowing expenses. The Bitcoin upside compensates for the reduced rate, making the bonds competitive. If successful, this could set a precedent for future debt instruments, helping the government borrow more cheaply in a high-debt environment.

Building a Bitcoin Reserve

Issuing Bitcoin Bonds would position the U.S. as a major Bitcoin holder, creating a strategic reserve. This could:

- Hedge against inflation if the dollar weakens.
- Strengthen America's role in the digital economy.
- Enhance geopolitical leverage as cryptocurrency gains global traction.

Economic and Political Drivers

Politically, Bitcoin Bonds align with innovative, forward-thinking leadership—potentially appealing in a post-tariff era focused on economic resilience. Economically, they address structural debt issues while tapping into the growing crypto market, offering a proactive solution to long-term fiscal challenges.

The Impact of Bitcoin Bonds on Bitcoin Price

While the market currently hinges its expectations for Bitcoin's rise on Federal Reserve rate cuts, many believe that only lower interest rates can unlock the liquidity needed to drive cryptocurrency prices higher. However, this view overlooks Bitcoin's notable recovery from approximately \$15,000 in early 2023 (CoinMarketCap, 2025)—a period when the Fed was still raising rates, yet liquidity remained abundant. This suggests that rate cuts are not the sole mechanism for injecting liquidity into the market. Back then, arbitrage trading via the Japanese yen was a primary source of financial market liquidity. Today, with the yen showing signs of impending rate hikes and the US dollar experiencing modest rate reductions, the conditions that once fueled yen-based arbitrage are fading. As a result, the cryptocurrency market urgently requires a new avenue for liquidity. Given Federal Reserve Chairman Jerome Powell's recent hawkish stance, significant rate cuts appear unlikely in the near term, making alternative solutions like BitBonds an appealing option.

The Bitcoin Policy Institute estimates that the full issuance of Bitcoin Bonds could raise up to \$2 trillion USD, a sum that represents just 20% of the U.S. debt refinancing needs projected for 2025. Under this plan, 10% of the proceeds—equivalent to \$200 billion USD—would be allocated to purchasing Bitcoin, injecting substantial buying pressure into the market. For context, Bitcoin ETFs saw a net inflow of around \$60 billion USD in 2024, driving a 119% price surge that year. Notably, this \$60 billion figure is only about one-third of the \$200 billion proposed for Bitcoin purchases through the bond initiative. Should the Bitcoin Bonds concept come to fruition, the resulting influx of capital could realistically propel Bitcoin's price beyond \$200,000 USD based on some analysts' predictions. BitBonds could serve dual purposes: enabling the government to raise funds at low interest rates while simultaneously flooding the market with liquidity independent of Fed policy. This creates a potential win-win scenario. Though still in the conceptual phase, the idea aligns with the interests of multiple stakeholders, including the crypto market and government financing needs. It's not implausible that the U.S. government might consider adopting such an approach in the future.

Navigating Bitcoin's Current Market Opportunity with CoinEx Margin Trading

Bitcoin's price has experienced a prolonged decline recently, yet emerging signals suggest this downward trend may be losing steam. Technical analysis indicates limited room for further short-term drops, pointing to a potential stabilization. On-chain data reinforces this view: as Bitcoin dipped into the \$74,000–\$76,000 range, notable buying activity surfaced, with large funds stepping in to acquire BTC. This surge suggests the current price zone could be establishing itself as a short-term support level, hinting at a shifting market dynamic. For traders looking to engage with this evolving landscape but constrained by limited funds, CoinEx's Margin Trading feature presents an attractive option. Picture starting with 100 USDT, borrowing an additional 400 USDT, and entering a BTC/USDT position during this period of consolidation. Should the market trend upward, your returns could far exceed those of standard spot trading. CoinEx simplifies the process: seamlessly transfer funds from your spot to margin account, access borrowing with ease, and optimize your strategy with minimal friction. CoinEx empowers you to amplify your potential through margin trading, offering a flexible tool to enhance outcomes. Move assets to your margin account, borrow USDT, and take a long position on Bitcoin at today's levels. When conditions improve, close your trade, settle the loan, and secure your gains. Whether you're an experienced trader or new to the space, CoinEx's margin trading provides an accessible, high-impact way to participate in Bitcoin's next chapter.

Conclusion

Bitcoin Bonds (BitBonds) represent a groundbreaking fusion of fiscal necessity and cryptocurrency potential, poised to redefine both government financing and Bitcoin's role in a post-tariff economy. By offering a modest 1% interest rate—far below typical Treasury yields—BitBonds enable the U.S. government to address its staggering debt with lower borrowing costs, potentially saving billions annually. The innovative structure allocates 90% of funds to critical operations, such as debt servicing or infrastructure, while investing 10% in Bitcoin, harnessing its growth to generate surplus revenue. Beyond debt relief, BitBonds promise to reshape the cryptocurrency landscape. Their ability to inject liquidity into the Bitcoin market without Federal Reserve rate cuts offers a lifeline amid tariff-driven volatility. By blending stability, innovation, and crypto exposure, BitBonds bridge traditional finance and digital

assets, positioning Bitcoin as a cornerstone of a digital-first economy. As policymakers and investors navigate post-tariff challenges, BitBonds stand out as a visionary solution, with the potential to drive Bitcoin's value and secure America's financial future. - US state Arizona has introduced a new crypto-related bill that protects the rights of Bitcoin miners. - The state has seen the discussion of several cryptocurrency bills over the past few months. With the US Federal Reserve announcing CPI data, investors expected the crypto market to react positively. However, the leading cryptocurrency Bitcoin fell modestly to the \$80K range. Meanwhile, within the regulatory sector, several advancements occurred. US President Donald Trump signed a recent crypto bill that repels the IRS DeFi broker rule. Notably, the US state of Arizona, which has passed several crypto bills over the past few months, announced a recent bill. According to the latest reports, the Senate has passed a bill "HB 2342" that caters to Bitcoin mining. This bill, called the Bitcoin Mining Rights Bill, safeguards individual Bitcoin miners from being zoned. It also protects individuals who possess operating nodes at home and prevents usage restrictions. Previously, in several jurisdictions, Bitcoin mining had been banned due to the excess amount of electricity and high energy levels. This was seen as hazardous to the surrounding areas and natural habitats. However, Arizona's positive advancement might instigate other US states to take a more positive stance towards Bitcoin mining. How is Arizona's Stance on Bitcoin and Crypto? As aforementioned, over the past few months, multiple US states have discussed crypto-related bills. Arizona is one of the leading states in the forte. The US state has seen the discussion of five different crypto bills in the past two months alone. Recently, in January 2025, the state passed the Strategic Bitcoin Reserve Bill. Following this, it saw discussions of crypto bills that centered upon crypto ATMs, and Bitcoin as legal tender. Furthermore, the Arizona state has also explored crypto taxation and the government's imposition of taxes. Other states that have seen such pro-crypto bills include Missouri and Utah. Apart from these states, Oklahoma and Florida have also shown interest in a Strategic Bitcoin Reserve. With increasing interest in crypto, state governments plan to take the lead in the web3 revolution. Highlighted Crypto News Today:

- XRP/BTC pair shows bullish cross with 55-week EMA breaking above 155-week MA. - Previous occurrence in 2017 preceded 958% price rally to historic high. - Analyst projects possible \$16-29 price targets depending on Bitcoin's performance. A technical development has emerged for XRP as market analyst EGRAG Crypto identifies a rare bullish crossover on the XRP/BTC weekly chart, potentially signaling an explosive price movement ahead. This bullish signal comes as XRP shows signs of renewed momentum, reclaiming the \$2 mark with a 12.38% gain over the past 24 hours despite dropping 2.89% over the previous seven days amid broader market volatility. The technical indicator in question involves the 55-week Exponential Moving Average (EMA) crossing above the 155-week Simple Moving Average (MA) on the XRP/BTC pair. This rare crossover occurred on February 17, 2025, marking only the second time in XRP's trading history that such a pattern has formed on this timeframe. The historical significance of this pattern cannot be overstated. The last time this crossover materialized was on May 15, 2017, which preceded a staggering 958.97% surge in the XRP/BTC ratio. During that period, the pair climbed from deep lows to a peak of 0.00022104 BTC per XRP, coinciding with XRP's rise to its all-time high of \$3.8 in January 2018. XRP shows similarity to 2017 According to EGRAG Crypto, the current market structure bears striking similarities to the 2017 setup, suggesting that a similar explosive run could materialize in the coming months. Following the February 2025 crossover, XRP/BTC attempted to retest the 55 EMA but failed to make contact before bouncing. The analyst suggests that if a proper retest occurs now, the pair could drop from its current level of 0.00002424 to approximately 0.00001850. With Bitcoin trading around \$80,000 in such a scenario, this would temporarily push XRP down to about \$1.48 before potentially launching a significant rally. Assuming XRP/BTC repeats its previous performance with a 958% rally from the retest level, EGRAG projects the ratio could climb to roughly 0.000171 BTC per XRP. The price implications for XRP in fiat terms would depend heavily on Bitcoin's performance during this period. If Bitcoin trades near the Fibonacci 0.702 level at approximately \$97,000 when the XRP/BTC ratio reaches 0.000171, XRP could achieve a price of around \$16.5. However, more ambitious Bitcoin price targets would correspondingly lift XRP to even higher levels. For instance, should Bitcoin reach \$130,000, XRP would trade around \$22 at the projected XRP/BTC ratio. A Bitcoin price of \$150,000 would push XRP to approximately \$25, while a Bitcoin surge to \$170,000 could see XRP reach an impressive \$29. These projections assume both that the XRP/BTC ratio maintains momentum from its February bullish crossover and that Bitcoin continues its long-term uptrend.

- Pakistan plans to use extra electricity for the country's Bitcoin mining and AI data center operations. - Former Binance CEO CZ joined as a strategic adviser in the Pakistan Crypto Council. Pakistan is focusing on the growth and development of the country's crypto presence. It plans to use surplus energy for Bitcoin mining and AI data centers. The announcement came out after Binance's CZ joined the Pakistan Crypto Council as a strategic adviser. The Head of Pakistan Crypto Council and adviser to the Finance Minister is Bilal Bin Saquib. The Reuters report confirmed that Bilal revealed plans to use surplus energy for Bitcoin mining yesterday. They even started talking to several mining firms regarding the same. Pakistan consumers are turning to alternative energy sources, like solar energy, to avoid the high costs associated with electricity. This is the reason why officials are planning to use their extra electrical energy for crypto and AI industry development. Bilal stated that they are planning to establish Bitcoin mining and AI data centers in regions where excess electricity is available. This not only helps the country move forward in an advanced technological race but also utilizes the excess power instead of going to waste. Former Binance CEO CZ Joined the Pakistan Crypto Council Binance founder CZ is the most popular influential figure in the crypto space

and is known for his active social media presence. He made it to the headlines last week regarding his addition to the Pakistan Crypto Council. CZ joined the Pakistan Crypto Council as a strategic adviser to support the country in the advancement of blockchain development, crypto regulation, and assist with national initiatives to educate youth and increase crypto adoption. Bilal stated that the country is far ahead in terms of crypto adoption and usage despite the lack of regulation. The country also has one of the largest global freelancing economies, which could benefit from crypto advancements. He aims to bring regulatory frameworks to strengthen innovation and growth in the country's fintech space. Several global countries are following Donald Trump's pro-crypto stance in the US since his election in 2024. It will only be a matter of time until we see most countries coming up with clear regulatory frameworks for crypto to improve innovation and adoption. Highlighted Crypto News Today:

- Trump pauses tariffs for 75+ countries for 90 days, but hikes China tariffs to 125%. - U.S. stock market adds \$4T in minutes; S&P 500 up nearly 7%. - Bitcoin hits \$82K with 6.6% surge; \$75M in shorts liquidated. US President Donald Trump declared a 90-day pause of reciprocal tariffs with over 75 countries, sending shockwaves through traditional and crypto markets. The move, intended to help ongoing trade negotiations, resulted in a behemoth rally on Wall Street and propelled Bitcoin into record territory at \$82,000. Only 24 hours after Trump's blanket reciprocal tariff policy took effect, a measure that had left markets in shock and trade war anxieties on the rise the President seemed to have had a change of heart. Laying praise on constructive talks and avoiding retaliatory measures by more than 75 countries, Trump formalized the moratorium in a Truth Social post. Based on the fact that more than 75 countries have denounced representatives of the United States and that those countries have not, at my strong urging, reciprocated in any way, shape, or form against the United States, I have ordered a 90-day PAUSE, Trump said. Trump pauses tariffs for the World, But Not for China While extending an olive branch to the rest of the world, Trump came hard at China. He declared an emergency hike in tariffs on Chinese goods to 125%, up from the earlier announced 104%. The action came in the wake of what he termed as China's "lack of respect" for global markets. "Sometime, hopefully not too far away, China will come to realize that the cheating of the USA, and other countries, is no longer sustainable or acceptable," Trump said. China hit back by applying an 84% duty on US imports, restricting exports by US businesses, and filing a new case with the World Trade Organization (WTO), ratcheting up tensions between the world's two largest economies Markets React: The \$4 Trillion Stock Value Rally Wall Street exploded with news of Trump's tariff timeout. Within an unbelievable 15 minutes, the US stock market had a staggering \$4 trillion. value added. This sent the S&P 500 soaring. nearly 7%, while tech stocks recorded their biggest one-day rally in years. Analysts credited the rally to investor relief, as the halt indicated a possible cooling-off in what had been poised to be an all-out global trade war. Bitcoin Breaks The crypto community was not exempt. Bitcoin rallied 6.6% of \$82,000, taking advantage of investor optimism and new risk appetite. Over \$75 million worth of BTC shorts were liquidated in the previous hour alone, according to market data. The total crypto market capitalization is \$2.5 trillion, still modest by today's \$4 trillion rise in traditional equities yet increasingly prominent as virtual assets further make their way into mainstream global financial systems. The European Union, having plans to impose a 25% retaliatory tariff on US goods next week, can now pause with the 90-day reprieve. Canada's trade ministry also showed a potential standstill on countermeasures following the announcement. But the US-China trade war remains volatile, and Beijing does not incline to give an inch. China's Ministry of Commerce declared, If the US insists on further increasing its economic and trade restrictions, . China has the firm will and vast resources to fight to the end. Trump's tariff break might be a strategic move to defuse global tensions and focus the trade war on China alone. With the stock market rallying and Bitcoin posting all-time highs. The announcement has, thus far, restored optimism to markets. Highlighted Crypto News Today Binance Futures Unveils LDUSD: New Reward-Bearing Margin Asset to Boost Capital Efficiency

- Bitcoin dropped 4.1% to \$76,550, while Ethereum slid 8.3%, its lowest since March 2023. - Trump's tariffs intensified trade war fears and global market turmoil. Bitcoin and Ethereum plunged on Wednesday as U.S. President Donald Trump's new tariffs on Chinese goods officially took effect. The sweeping trade measures have sparked a sharp downturn across global markets, triggering \$411 million in crypto liquidations in the past 24 hours. Bitcoin dropped 4.1% to \$76,550, while Ethereum lost 8.3%, marking the steepest fall among the top ten digital assets. Ethereum also hit its lowest level since March 2023. Major altcoins followed suit, adding to the widespread market pain. Traders blamed the plunge on fears that Trump's aggressive tariff policy could deepen the global economic slowdown. "Markets need a circuit breaker on sentiment as much as anything else," said Pav Hundal, lead analyst at Swyftx. He noted that over \$1.2 trillion in crypto value has vanished since February. Global Markets Roiled as Bond Yields Surge According to CoinGlass, liquidations surged as Bitcoin briefly dipped below \$75,000 late Tuesday. This drop occurred less than three hours before the new tariffs kicked in. Since its January high above \$109,000, Bitcoin has fallen nearly 30%. Asian markets also suffered. Japan's Nikkei 225 dropped 2.6% by midday Wednesday. Australia's ASX 200 slid 2%. In the U.S., the S&P 500 fell 1.5% on Tuesday and is now nearing bear market territory with a 20% loss since mid-February. Bond markets reflected the panic. The 10-year Treasury yield spiked between 4.2% and 4.4% Tuesday, posting its fastest intraday rise since World War II. The three-year Treasury auction also flopped, showing weak foreign investor demand. The 30-year yield rose 56 basis points in three trading days. That's the largest such jump since January 1982, according to Bianco Research. "This kind of historic move is caused by a forced liquidation," Jim Bianco posted on X. Rising yields mean falling bond prices and higher government borrowing costs. With U.S. debt already high, this could worsen the federal deficit. At the same time, smaller tokens dropped even further, while traders warned of more downside. Highlighted Crypto News Today Kaspersky Identifies a Crypto-Theft Malware on Microsoft's SourceForge

- Bitcoin (BTC) gained 3.35% in 24 hours, now trading at \$79,868.38. - Its market cap reached \$1.58 trillion, dominating the \$2.53T global crypto market. Bitcoin climbed 3.35% in the last 24 hours, now trading at \$79,868.38. Its market capitalization surged to \$1.58 trillion, tracking the wider crypto market's 3.38% daily rise. Meanwhile, Bitcoin's share of the total \$2.53 trillion crypto market cap remains dominant. However, trading volume slid 6.75% to \$67.22 billion, suggesting less momentum despite the price recovery. With a fully diluted valuation of \$1.67 trillion and a 4.23% volume-to-market cap ratio, BTC shows strong valuation but mixed short-term liquidity. The total circulating supply holds at 19.84 million BTC, close to the maximum cap of 21 million. Supply pressure remains low, which historically favors bullish price action. Yet, the falling 24-hour volume may limit immediate upside moves. Price recently rebounded from lows near \$75,000, now holding just under \$80,000. If resistance at \$80,800 breaks, BTC could push toward \$82,500. Conversely, if it fails to hold \$78,000, a slide toward \$76,500 may follow. Can BTC Sustain its Momentum? Technical indicators present a mixed setup. The Relative Strength Index (RSI) reads 37.52, while its moving average stands at 46.10. This reveals bearish momentum, although the gap between the two has narrowed. If the RSI crosses above its average, it may signal an incoming short-term recovery. Still, current levels show that BTC is below the neutral 50 zone, pointing to mild oversold conditions. The Chaikin Money Flow (CMF) index remains negative at -0.19, suggesting capital outflows continue. This confirms that buyer conviction is still weak despite the price rebound. Until CMF shifts above zero, bulls may struggle to regain full control. The Moving Average trend supports this caution. The short-term moving average remains under the longer-term trend line, with no bullish crossover yet. If that crossover emerges, momentum could accelerate upward. Price action remains compressed within a narrow channel. Support stands near \$75,600. Resistance is tight near \$80,800. A clear breakout in either direction will dictate the next significant move. Highlighted Crypto News Today Momentum Builds for CORE: Can It Sustain the 20% Climb?

- Block Inc. CEO Jack Dorsey said Bitcoin would fail if only used as a store of value on the "Presidio Bitcoin" podcast episode. - Bitcoin maximalists don't agree with Jack Dorsey as Bitcoin being a store of value can position it as an alternative to devaluing fiat currencies. Bitcoin is the first successful application of blockchain technology, which made it possible to create the entire crypto ecosystem we see today. Satoshi Nakamoto created Bitcoin with a vision of creating an electronic peer-to-peer payment network. His main purpose was to create a digital currency that could be used for everyday payments across the globe. However, Bitcoin is becoming more popular by the year as a store of value (SOV) rather than a medium of exchange. Crypto community even refers to as "Digital Gold," comparing its nature of limited supply and increasing value to that of gold. The recent comments by one of the Bitcoin advocates, such as Jack Dorsey, have resurfaced the debate of Bitcoin's actual use case. During the "Presidio Bitcoin" 21 in 21 podcast episode, Jack Dorsey said Bitcoin succeeds if BTC holders use it for everyday payments. In his words, "I think it has to be payments for it to be relevant on the every day. Otherwise, it's just something you kind of buy and forget and only use in emergency situations or when you want to get liquid again. So I think if it doesn't transition to payments and find that everyday use case, it just gets increasingly irrelevant. And, that's failure to me." Dorsey believes creating a simple and accessible payment solution is important for today's fintech world. He thinks that with time and increased accessibility, the cryptocurrency volatility issue will subside. Jack Dorsey is one of the early and strong Bitcoin advocates. He firmly believes in the original vision of Bitcoin. Jack Dorsey's View on Bitcoin Sparked Debate What Jack Dorsey says is true to the actual purpose behind Bitcoin's creation. However, the asset has come a long way from being a medium of exchange. Its deflationary supply and incredible value growth over the years have made it best suitable as a store of value. Lead Developer at Bitcoin Keeper Ben Kaufman made a post on his X account. He seems to disagree with what Jack Dorsey said in his podcast. Ben Kaufman made a strong case, saying, "Bitcoin requires as a store of value because governments erode the value of their currencies. It is needed for payments to circumvent financial censorship. Currency devaluation affects everyone, while payment censorship affects small groups." Bitcoin maximalist Dan Held clarified on this debate years ago on one of his threads on X. He argues that Bitcoin was purpose-built to first be a store of value. Dan Held even quoted what Satoshi Nakamoto said in his early comments after the Bitcoin whitepaper publication. It says, "If there were nothing in the world with intrinsic value that could be used as money, only scarce but no intrinsic value, I think people would still take up something. It might make sense just to get some if it catches on. If enough people think the same way, that becomes a self-fulfilling prophecy." Bitcoin is definitely a noteworthy creation that holds the potential to change the global economy. Governments coming forward to adopt Bitcoin for national reserves. This would only increase its store of value in the coming years. No matter if it will be used as a medium of exchange or a store of value, Bitcoin is something that might not be irrelevant in the coming years. - Bitcoin fell under \$80K, as market crash by liquidated \$600 million in trades - Stock markets dropped badly, having the worst week since 2020. - Trump's new EU tariffs may cause a global trade fight as countries plan to strike back. The price of Bitcoin fell rapidly from close to \$83,000 to below \$79,000 within a matter of hours. The sudden dip created a wave of liquidations in which some \$600 million of leveraged bets were erased based on CoinGlass data. They were high-risk positions in which the traders had used borrowed funds anticipating Bitcoin to rise, but the price decline got them caught off guard. What Caused the Market crash? Prior to this crash, Bitcoin had been performing well and even better than large stock markets. Some thought it was behaving like a digital gold a safe haven. But with this decline, fears are surfacing again. Analyst Jonatan Randing stated that Bitcoin is near touching its 50-week EMA (a typical technical level), which typically serves as a solid support during bull markets. He also asked if we are even in a bull market anymore. Meanwhile, tensions in international markets are escalating. The former US President Donald Trump issued a 20%

tariff on EU goods. The EU is retaliating by planning to impose their own tariffs. This tit-for-tat has sent shivers down the spines of investors. More Countries Get Involved It's not just the U.S. and Europe. Other countries are also reacting: - China may reintroduce its old tariffs on U.S. goods. - India is thinking about taxing American products like electronics and farm items. - Mexico and Canada are also worried and may review their trade deals with the U.S. - Brazil is watching the situation closely and could act if needed. Global stock markets are already under pressure. Last week was the worst for the S&P 500, NASDAQ 100, and Dow Jones since the COVID crash of 2020. Investors worry that these new trade tensions might slow the economy and inflate prices. As Bitcoin plunged below \$80,000, triggering over \$600 million in leveraged position liquidations within hours (CoinGlass). U.S. stocks had their worst week since 2020, with S&P 500 down 3.1%, NASDAQ 100 down 4.6%, and Dow Jones down 2.9%. Trump's 20% tariff on EU imports sparked fears of a global trade war, shaking both equity and crypto markets. Market volatility is expected to continue until clearer resolutions on tariffs and trade emerge. Highlighted Crypto News Today Ethena (ENA) Slides Below \$0.30 as Bearish Signals Intensify

- Bitcoin trades at the \$83,700 price level while the stock market has lost over \$3.5 trillion. - Crypto experts and market analysts are celebrating as Bitcoin decouples from the traditional stock market. Donald Trump's Presidency has brought significant changes to the crypto industry in terms of market prices and regulation. After the announcement of Trump's win in 2024, the crypto market went on a short bull run where Bitcoin and several altcoins recorded all-time highs. However, the anticipated extension of the bull run is not happening in 2025. Trump's crypto regulation initiatives are beneficial for broader crypto adoption. But his tariff announcements are not helping the market prices. Bitcoin price took a hit last month and lost its \$90K price level. The largest crypto by market cap has been trading at the same price range of \$87,000 - \$81,000. Bitcoin Price in the Last Week (Source: CoinMarketCap) BTC is trading at \$83,640 with a 2.32% rise at press time. The cryptocurrency recorded weekly and monthly price movements of +1.70% and -8.49% respectively. While its market cap is hovering around \$1.65 trillion, 24-hour trading volume dropped by 17.76%. Bitcoin Shows Resilience While Stock Market Plunges The much-anticipated Trump's reciprocal tariffs were announced on the Liberation Day. As expected by market leaders and experts, these tariffs impacted US stock markets negatively. Market Analyst platform Watcher.Guru reported that the stock market lost \$3.25 trillion earlier today, while only \$5.4 billion was added to the market. S&P 500 lost \$5.4 trillion in marketcap in the last couple of days. The BTC market showed strong resilience in contrast to the stock market. BTC market price recorded a seven-week low of above \$81K on April 3, but quickly regained its \$83K price level. Bitcoin's ability to hold on to its previous price range without dropping further is garnering attention across the market. #bitcoin decoupling finally. was thinking the coupling was fake. maybe market makers using bitcoin market shortage of fiat liquidity to auto-correlate bitcoin, noticeable on US market open. - Adam Back (@adam3us) April 4, 2025 Bloomberg analyst James Seyffart made a post on X expressing his shock over Bitcoin's resilience. He didn't think BTC floats above the \$80K price level under present market conditions. The founder of Blockstream, Adam Back, replied to this post, stating that BTC is decoupling from the traditional stock market. Back also said that he always thought the coupling between BTC and the traditional stock market was fake. His post read, "Maybe market makers using Bitcoin market shortage of fiat liquidity to auto-correlate Bitcoin, noticeable on US market open. - What's Next For Bitcoin Price? #Bitcoin \$BTC is up against a major resistance cluster at \$87,000, where the 50-day MA, 200-day MA, and the descending trendline from the all-time high all converge. pic.twitter.com/llxPXsfQDY - Ali (@ali_charts) April 5, 2025 The resilience of the Bitcoin market price is making investors and traders anticipate its next course of action. Some people still cannot believe Bitcoin is decoupled from the traditional stock market. BTC is raising hopes of investors for a further price rally by staying firm on its price level. Renowned market analyst Ali Martinez made a post earlier today regarding the Bitcoin market price. Based on his analysis, Bitcoin is going for a major resistance cluster at the \$87,000 price level. The 50-day MA, 200-day MA, and descending trendline from Bitcoin's ATH value all seem to converge at this price level. If Bitcoin succeeds in breaking the resistance at \$87K, we can anticipate a further price rally. Even though Bitcoin decoupled from the traditional stock market, global macroeconomic conditions must support it to sustain its price rally. Singapore, Singapore, April 4th, 2025, Chainwire Yala, the Bitcoin-native liquidity layer enabling cross-ecosystem financial access, today announced the upcoming launch of Yala RealYield, a curated marketplace for real-world asset (RWA) yield opportunities powered by Bitcoin. The new platform will enable BTC holders to earn regulated, risk-adjusted yields by allocating capital into tokenized financial products, including U.S. Treasury bills, private credit, corporate bonds, and real estate-backed assets. Yala RealYield is designed as a unified access point to all of Yala's RWA-related integrations. Rather than operating as a standalone product, it consolidates partnerships and investment opportunities into a structured platform where users can explore, compare, and combine diverse RWA yield sources, each offering distinct risk profiles, durations, and APYs. By enabling global, 24/7 access to high-quality, compliant RWA opportunities, Yala RealYield democratizes investment strategies previously limited to institutional investors and high-net-worth individuals. "Real-world assets are rapidly becoming the next frontier in blockchain finance. With RealYield, we're offering Bitcoin holders a reliable, transparent way to earn real returns without leaving the decentralized economy," said Kaitai Chang, COO at Yala. "This is a foundational step toward integrating BTC with the broader financial system." Key Features of Yala RealYield: - Curated RWA Marketplace: Investors can access a wide selection of tokenized real-world yield opportunities, including sovereign debt, real estate, and private credit - all with transparent terms regarding risk, maturity, and return. - Customizable Yield Strategies: Users can mix and match products to create bespoke portfolios tailored to individual preferences. - Seamless Bitcoin Integration: All investments

begin with BTC, ensuring on-chain transparency, verifiability, and security. - Compliance-First Design: Robust legal and regulatory reviews to ensure real-world assets can be securely and legally onboarded. - Unified Experience: Yala offers a single dashboard for minting, trading, and managing RWA and DeFi positionsâ€eliminating the need for fragmented platforms. - Institutional-Grade Access: Multi-signature custody, on-chain governance, and permissioned access provide a secure foundation for institutional participation. - Incentivized Participation: Yield farming and staking mechanisms will be introduced to drive engagement across both retail and institutional segments. Personalized Yield Through a Marketplace Model Yala RealYield operates as a marketplace, enabling users to browse and select from a range of yield products across categories such as: - Risk Profile â€ From low-risk instruments like U.S. Treasuries to higher-yield private credit vehicles. - Time Horizon â€ Options range from short-duration liquidity to long-term fixed-income strategies. - Target Returns â€ Each product includes APY benchmarks to help users align returns with personal investment objectives. Yala will also introduce the RWA Vault Allocation Framework, a model that packages diversified real-world assets into unified yield vaults, each with defined allocation weights. This mirrors traditional asset allocation strategies but with the added composability and efficiency of Web3 infrastructure. Strategic Vision and Market Opportunity Yala RealYield addresses a long-standing gap in crypto: unlocking Bitcoinâ€™s immense liquidity for productive, low-risk yield generation. The launch comes as institutional interest in tokenized real-world assets accelerates, with the total addressable market for RWAs projected to reach trillions of dollars in the coming years. By combining compliance-first infrastructure, seamless BTC access, and a growing roster of RWA partnerships, Yala is well-positioned to become the leading yield gateway for Bitcoin in traditional financial markets. â€Bitcoin remains the most underutilized source of liquidity in the global financial system,â€ said Kaitai. â€RealYield allows us to connect that capital to compliant, income-generating products, building a future where BTC earns real-world returns.â€ Looking Ahead Yala plans to expand the RealYield marketplace over the coming months through additional integrations, refined yield packaging, and improved tooling for developers and institutional users. Long-term, Yala will support the use of RWA-backed positions as collateral for stablecoin minting, creating deeper synergies between DeFi and traditional finance. About Yala Yala is building a liquidity layer to unlock Bitcoinâ€™s untapped yield across DeFi and RWAs. Users can deposit BTC and access seamless liquidity, enabling efficient capital movement and yield opportunities across ecosystems, chains, and protocols. To learn more, users can visit www.yala.org or follow Yala on X at @yalaorg. Contact Yala media@yala.org

- Bitcoin has factored in a modest price drop in the last 24 hours. - The cryptocurrencyâ€™s daily trading volume shows a 29.39% dip as per CMC data. In the last 24 hours, the cryptocurrency market has seen a modest price increase of 0.85%. While international tensions rise in the economic sector, investors watch with bated breath how the digital assets will react. However, so far the external factors have not caused any outcomes in cryptocurrency prices. Notably, leading cryptocurrency, Bitcoin has factored in a modest price drop of 0.34% and is trading at the margin between the \$82K and \$83K level. For the major part of the day, it was trading at the \$82K range and only recently surpassed intra-day resistance. At the time of writing, BTC was trading at \$82,487.50 as per CMC data. A few hours ago, it tested the \$84K level but failed to hold prices at the range. Meanwhile, leading analysts have discussed similar predictions for Bitcoin in the past day. While Trump initiated the Tariff war, the whole economic sector is watching other nationsâ€™ reactions to the recent hike in trade fares. Subsequently, prominent personalities such as Micheal Saylor and Arthur Hayes have turned their attention to Bitcoin. Saylor said that the cryptocurrency doesnâ€™t have tariffs. Hayes, on the other hand, said that these tariffs could benefit Bitcoin in the long run. He says that it removes global imbalances and weakens fiat currencies. Is Bitcoin Showing Signs of Bullish Rebound? Another prominent crypto analyst, Ali (@ali_charts) stated that Bitcoinâ€™s short-term holder realization price hit \$90,570. This suggests that the cryptocurrency is getting ready to resume its bull run. Meanwhile, on looking at its technical indicators they also suggest signs of recovery. Its Moving Average Convergence Divergence (MACD) MACD line stands above the signal line indicating positive sentiment. Moreover, its RSI value stands at 44.60 as per TradingView data. This indicates that the cryptocurrency is inching closer to a neutral market sentiment. Meanwhile, other altcoins such as PI and Cosmos have shown mixed price movements in the last 24 hours.

As Bitcoin (BTC) continues to break new records, some investors speculate whether Shiba Inu (SHIB) could reach \$1 if BTC hits \$500,000. While this seems improbable for SHIB, a different token is emerging as a promising contenderâ€Lightchain AI. Currently available at just \$0.007125 during its presale, Lightchain AI is drawing significant attention for its innovative fusion of blockchain and artificial intelligence. Analysts project it could soar to \$7, offering remarkable growth potential. In a shifting market, Lightchain AI stands out as a compelling opportunity for investors seeking substantial returns. Shiba Inuâ€™s \$1 Dream- Can It Really Happen if Bitcoin Hits \$500,000? One of the main factors influencing the value of Shiba Inu (SHIB) is its association with the performance of Bitcoin (BTC). SHIB is expected to be able to gain significantly only if Bitcoin hits \$500,000, according to some sources of predictions. For example, according to Google Bard estimates, SHIB can reach the price of \$0.0000495-0.0000990 during these conditions. However, these predictions are speculative at best and rely on an array of different factors, including market dynamics and SHIBâ€™s circulating supply. With SHIB currently trading at \$0.0001219, for it to soar to \$1 would mean a significant raise which indicates the difficulty of reaching the set goals. Why This \$0.007 Token Has Potential to Reach \$7 Lightchain AI, priced at just \$0.007, holds immense potential for growth, with many speculating that it could rise to \$7. The platformâ€™s governance integration allows token holders to actively participate in decisions, ensuring a decentralized and community-driven evolution. This transparent and inclusive governance model strengthens investor confidence, making Lightchain AI a long-term investment opportunity. Additionally, dynamic resource allocation optimizes the networkâ€™s performance by adjusting computational resources based on task complexity, ensuring
