

neutral stance. Ryan Berckmans, an Ethereum community member, emphasized in July the need of Ethereum builders limiting marketing, saying that doing otherwise might lead to a situation where winners and losers are more apparent. When it comes to the Ethereum ecosystem, Buterin is a major player. Ethereum could be depending too much on Buterin for guidance, according to Cardano creator Charles Hoskinson, who recently made the comment in an interview. Highlighted Crypto News Today:

As the growth of the crypto market reaches another level, many indicators suggest that major assets will be a decisive year in 2025. Leading the charge are Bitcoin, Ethereum, and Rexas Finance, a newly emerging token already praised as the “Cardano-Killer.” These three tokens are expected to bring great gains: Bitcoin targets \$150,000; Ethereum is set to double its present value; Rexas Finance is ready to soar by 2500%. Bitcoin’s “Ticking Time Bomb” Setup Targets \$150K by 2025 With its present price of \$63,157.44, Bitcoin, the leading cryptocurrency, is forming a classic “cup and handle” pattern, usually preceding a significant positive run. By early 2025, this technical arrangement could see Bitcoin rising above the \$100,000 mark and maybe reaching \$150,000. The “cup and handle” formation is coming up to the closing stages since late 2021. The cup indicates a cost accumulation period, while the handle indicates a consolidation range underneath the \$65000 “\$69000 resistance. The anticipated neckline breakout bullish price objectives are in the range of \$110,000 “\$130,000 for such a bullish breakout with the possibility of up to \$150,000 gradually building up steam. Important indicators, including the Crypto Fear & Greed Index and the Bollinger Bands Width (BBW), also point to low volatility and oversold conditions, respectively—both elements that usually precede significant upward movements. Many experts believe that Bitcoin is ready for an explosive breakout in the next months as global liquidity rises and BTC supply tightens. Ethereum to Double, Rising Over \$5,000 by 2025 Currently trading at \$2,651.34, Ethereum has jumped over 12% in the past week following the most recent U.S. Federal Reserve rate cut, so improving the asset’s positive future view. By 2025, Ethereum is predicted to 2x in value, surpassing the \$5,000 mark as institutional acceptance grows and the network expands. Being the backbone of decentralized apps (DApps) and decentralized finance (DeFi) grants Ethereum a significant edge in the crypto space. Layer-2 scaling solutions and other blockchain systems have lately attracted competition, but Ethereum’s supremacy in the smart contract market is still unoppressed. Recent developments, including Danksharding and future zero-knowledge SNARK implementation, are expected to increase scalability, lower gas fees, and improve privacy, so augmenting institutional interest. Ethereum needs a comeback in its total value locked (TVL) in DeFi and a reversal of the recent net outflows from Ether exchange-traded funds (ETFs) to reach its \$5,000 goal. Any crypto portfolio should include Ethereum since analysts believe that as more institutional investments move into the asset, it will recover its former highs and keep rising. Rexas Finance (RXS): The “Cardano-Killer” Set to Explode 2500% by 2025 Although Bitcoin and Ethereum are well-known, Rexas Finance (RXS) is fast becoming the next major player in the crypto market. Dubbed the “Cardano-Killer, Rexas Finance is a revolutionary platform aiming to upend established finance by bringing assets, including real estate, gold, and more, onto the blockchain, focused on real-world asset (RWA) tokenization. Rexas Finance is one of the most exciting tokens available since, with its present presale price of \$0.050, it is expected to explode by 2500% by 2025. The special value of Rexas Finance is its ability to tokenize actual assets, enabling users to purchase, sell, and co-own physical objects with just a few clicks. This creates fresh opportunities for fractional ownership and worldwide access to assets once limited by geographical or financial constraints. Given the estimated trillions of tokenized assets in the total addressable market, Rexas Finance is positioned to take a major market share. With 60.92% of its \$2,750,000 target attained, the project’s Stage 3 presale has already raised over \$1,479,947. The sales of over 39,598,929 RXS tokens point to no slowing down of investor demand. Early investors can still enter at \$0.050; the next stage price is set at \$0.060 and the final listing price is \$0.20, by the end of the presale those early investors could see a 6x return on their investment. Apart from its innovative tokenizing approach, Rexas Finance presents several opportunities that help it to be a strong competitor in the DeFi market. While the Rexas DeFi platform offers strong distributed solutions for trading and compound interest, the Rexas Token Builder lets consumers easily tokenize their assets. Come 2025, Rexas Finance is ready to take the front stage in the crypto market as experts predict a whooping 2500% token rise. Conclusion Looking forward to 2025, cryptocurrencies seem to have a bright future. The top three tokens to keep an eye on are Bitcoin, Ethereum, and Rexas Finance; each presents special chances for significant returns. The crypto market is poised for another revolutionary phase, whether it’s Bitcoin’s potential to hit \$150,000, Ethereum’s road to \$5,000, or Rexas Finance’s explosive 2500% increase. Now is the chance to maximize this innovative potential and set yourself up for the approaching bull run by joining the RXS token presale. For more information about Rexas Finance (RXS) visit the links below: - Website: <https://rexas.com> - Win \$1 Million Giveaway: <https://bit.ly/Rexas1M> - Whitepaper: <https://rexas.com/rexas-whitepaper.pdf> - Twitter/X: <https://x.com/rexasfinance> - Telegram: <https://t.me/rexasfinance> Disclaimer: TheNewsCrypto does not endorse any content on this page. - Institutional players like Cumberland and ParaFi Capital moved millions in ETH. - U.S. spot Ethereum ETFs saw a combined net inflow of \$58.7M on Sep 27. Ethereum whale transactions have surged this week as the price of ETH shows signs of recovery. A notable whale, inactive for four months, made significant moves, cashing out 12,979 ETH valued at \$34.3 million. This whale, with a profit of \$58.8 million, originally acquired 21,632 ETH from ShapeShift and Poloniex for \$7.074 per ETH in 2016. Since May, the whale has sold 15,879 ETH, earning \$43.5 million at an average price of \$2,739 per ETH. The whale now holds 5,760 ETH, valued at \$15.5 million, and has realized a total profit of 141x its initial investment. Further, the institutional activity also remains strong. Two major institutions, Cumberland and ParaFi Capital, made significant movements. A wallet linked to Cumberland deposited

11,800 ETH (\$31.88 million) into Coinbase. Meanwhile, ParaFi Capital withdrew 5,134 ETH (\$13.83 million) from Lido and deposited it into Coinbase Prime. These transactions reflect strategic selling from major entities during Ethereum's price recovery. Additionally, a whale linked to 3AC made a remarkable trade this week. This sniper spent 238 ETH (\$641.5K) to acquire 28.03 million 3AC tokens when the token first began trading. Shortly after, they sold 24.95 million 3AC tokens for 799 ETH (\$2.15 million), pocketing 561 ETH (\$1.5 million) in profit. They still hold 3.08 million 3AC tokens, currently valued at \$369,000. In contrast to the ETH market, the U.S. spot Ethereum ETF market has seen a significant influx of capital. On September 27, ETFs experienced a combined net inflow of \$58.7 million. Fidelity's FETH recorded the largest share with \$42.5 million in inflows, followed by BlackRock's ETHA (\$11.5 million) and Bitwise's ETHW (\$5.4 million). Meanwhile, Grayscale's ETHE experienced net outflows of \$10.7 million. These ETF movements suggest increasing institutional interest in Ethereum as the market rallies. Ethereum's Performance in the current market Ethereum's price is showing positive sign, currently trading at \$2,694.36, up 1.83% in the last 24 hours. Market capitalization stands at \$324.3 billion with a daily trading volume of \$16.5 billion. According to technical indicators, Ethereum's relative strength index (RSI) on the 4-hour chart is at 63.43, indicating mildly overbought conditions, while the RSI on the 1-hour chart reads 41.33, reflecting a short-term bearish momentum. The 9-period and 21-period moving averages on the 4-hour chart show a positive crossover, signaling potential further bullishness. Support is currently set at \$2,630, with resistance at \$2,700. If Ethereum can maintain momentum above \$2,700, the price could aim for the next level at \$2,800. However, if support at \$2,630 breaks, Ethereum may retest the \$2,600 level.

- Ethereum struggles to stabilize at \$3,000 due to weak institutional inflows. - October expected to bring shift in sentiment, potentially boosting ETH price. - Technical analysis suggests possible 23% rise to \$3,258 if breakout occurs. Ethereum (ETH) finds itself at a critical juncture as it grapples with the challenge of establishing a firm foothold around the \$3,000 mark. The second-largest cryptocurrency by market capitalization has faced headwinds in the form of tepid institutional inflows and wavering investor confidence. However, market observers anticipate a potential shift in sentiment and price action as October approaches, contingent upon increased institutional participation. The lackluster performance of spot Ethereum ETFs has been a significant concern for the altcoin's bullish outlook. Matt Mena, crypto research strategist at 21.co, attributes this weak inflow to various factors, highlighting the need for a change in institutional sentiment to drive ETH's price momentum. What can cause Ethereum to pump? Alvin Kan, COO of Bitget Wallet, outlines several external factors that could propel ETH back to the \$3,000 threshold. He emphasizes the importance of technical innovation, particularly in AI, payments, and restaking projects deployed on the Ethereum network. Additionally, Kan points to potential improvements in macroeconomic liquidity, suggesting that a Federal Reserve rate cut could enhance ETH's appeal as an income-generating asset. However, bearish signals are emerging from investor behavior. Ethereum's 30-day Market Value to Realized Value (MVRV) Ratio currently sits at 6.5%, placing it in a precarious "danger zone." This metric, which measures profits and losses, suggests that investors may be inclined to realize profits by selling their holdings, potentially triggering a correction. From a technical perspective, Ethereum is on the verge of breaking out of a descending channel pattern that has constrained its price action for the past two months. A successful breakout could potentially catalyze a 23% surge, targeting the \$3,258 level. However, this optimistic scenario heavily relies on improved institutional inflows and sustained bullish sentiment.

- NEIRO whale activity has surged, with notable purchases. - Wintermute holds 5.3% of the total supply, adding to market stability. Neuro Ethereum (\$NEIRO) is currently in an accumulation phase, with significant whale activity noted over the past week. According to on-chain data, several key whales have increased their holdings, adding to the growing momentum behind the asset. Whale 0x6ab, for example, accumulated 17.7 million NEIRO at an average price of \$0.086. This buying spree indicates potential bullish sentiment, especially with \$NEIRO now priced at \$0.0915, reflecting a 2.12% gain in the last 24 hours. Trading volume, however, shows mixed signals. Over the last 24 hours, the volume fell by 2.96%, reaching \$28.37 million, which translates to a 30.75% volume-to-market cap ratio. This drop in volume contrasts with the rising market cap of \$92.27 million. Despite this, the consistent whale purchases suggest a strategic build-up, possibly in anticipation of a larger market move. Could Whale Activity and Neutral RSI Propel \$NEIRO Higher? One interesting aspect of \$NEIRO's performance is the involvement of well-known entities like Wintermute. As a major market maker, Wintermute holds 52.97 million NEIRO tokens, about 5.3% of the total supply. This large stake, coupled with the actions of other whales, may have a stabilizing effect on the asset's price in the near term. Looking at the technical indicators, \$NEIRO's price movements in the last 7 days suggest some volatility, with highs reaching \$0.098 and lows close to \$0.086. The Relative Strength Index (RSI) is trending toward neutral, suggesting the asset is neither overbought nor oversold. This neutral zone leaves room for upward movement if buying pressure continues. As Binance considers new listings, the potential for \$NEIRO to be added to their spot market grows. With an expanding decentralized base and increasing market cap, \$NEIRO is positioned for broader visibility. Whether this accumulation phase will lead to a price breakout depends on sustained buying interest and rising trading volume. Highlighted Crypto News Today Dogecoin (DOGE) Climbs to \$0.12 as Bulls Seek a Continued Rally

- Ethereum price showed a modest increase following its previous gains over the last few days. - The altcoin's daily trading volume surged by 20.38% as per CMC data. In the theatre of Finance, cryptocurrencies, Bitcoin and Ethereum, are emerging as top performers holding audience attention unfettered. The last 24 hours, saw Bitcoin climb to its crucial resistance level " \$65K. Following this, Ethereum broke its \$2.5K resistance yet again this week. The altcoin, despite its recent price slump, is expected to recover in the coming months. Notably, in the last 24 hours, Ethereum's price

incurred a modest increase of 0.62%. The altcoin has exhibited increased volatility in the past few days, as bulls and bears attempted to stage combat. However, the recent price actions exhibit a positive momentum as ETH prices managed to climb beyond \$2,650 during the day. At the time of writing, Ethereum was trading at \$2,645 as per CMC data. Additionally, ETH price also inched closer to \$2.5K momentarily in the last 24 hours, but the token resisted the bearish dominance. If Ethereum sustains its positive momentum, it can be expected to face resistance at \$2,700. On inferring its daily price chart, Ethereum shows signs of overcoming its recent price slump at the \$2,300 to \$2,500 range. Meanwhile, the US spot ETH ETFs recorded modest outflows on September 27 breaking the two-day inflow streak. Grayscale's spot ETF recorded the highest outflow of \$36.02 million overshadowing inflows recorded by other ETFs. What to Expect for Ethereum's Price in the Coming Months? Ethereum price, in the last 7 days, shows a price performance of 3.93% increase. After the aforementioned price slump, the altcoin has begun to depict bullish candles. Moreover, the token's monthly price increase stands at 4.86%. This results majorly from the bullish turn that ETH has taken in the past few days. On inferring Ethereum's technical indicators, the Moving Average Convergence Divergence (MACD), the signal line stands above the MACD line as per TradingView data. This indicates a positive trend in price movements. Additionally, the token's RSI stands at 58.81 indicating the token's inching towards buying sentiment among investors. Moreover, if the altcoin manages to break its resistance at \$2,700 it can be expected to rally to \$3K. However, if it fails to sustain and transition the recovery into a bull run it might fall to a support level of \$2,294.

The crypto world is buzzing with predictions from a Bitcoin-friendly Van Eck expert, who has set the stage for a bullish run not only for the cryptocurrency giant Ethereum (ETH) but also for a rising star, ETFSwap (ETFS). As this forecast sinks in, smart investors are swiftly making their move, especially with ETFSwap's (ETFS) presale price standing at an attractive \$0.03846. Such forecasts from an industry leader signal that it's time to pay close attention. ETFSwap (ETFS) is set to join Ethereum (ETH) on its climb, making this a key moment for investors to secure their stake in a potential crypto boom. ETFSwap (ETFS): A High-Rise Altcoin With Game-Changing Offerings And Strong Foundation ETFSwap (ETFS) has rapidly emerged as a powerful contender in the crypto ETF market, now capturing the attention of investors worldwide. The endorsement by a Bitcoin enthusiast and Van Eck expert, pairing Ethereum (ETH) and ETFSwap (ETFS), holds tremendous significance. With Ethereum's blockchain acting as its robust foundation, ETFSwap (ETFS) offers innovative features that differentiate it from most other altcoins, presenting a unique investment opportunity with much better prospects for returns. Among its compelling advantages, ETFSwap's (ETFS) tokenized ETF products are a major draw. This feature expands investment options for crypto traders, combining traditional finance (TradFi) with decentralized finance (DeFi). Furthermore, ETFSwap (ETFS) has undergone a stringent audit by Cyberscope, with a clean slate report. The team behind ETFSwap (ETFS) has also passed KYC verification through SolidProof, giving investors additional peace of mind. It's not surprising that this Van Eck expert and Bitcoin guru has taken notice of ETFSwap's (ETFS) tremendous potential, forecasting it as a serious contender for a bullish run alongside Ethereum (ETH). ETFSwap's (ETFS) ongoing presale is attracting investors' attention. Its unique utilities, such as staking with an impressive 87% APR, and the ability to participate in liquidity pools, are just the beginning. The upcoming Beta platform, scheduled for release on September 28th, is expected to provide even more game-changing features for crypto ETF traders. Investors will have access to ETF prices, swapping features, and staking mechanisms, all backed by Ethereum's secure and scalable infrastructure. The innovation goes further; ETFSwap (ETFS) is preparing for Phase 2 of its platform launch, which will include AI-powered ETF trading tools like the ETF screener and ETF tracker tools. These tools will make ETF trading more efficient and insightful for users, drawing in more liquidity and institutional investors. A full ETF launch planned for 2025, supports the Van Eck expert's forecast that ETFSwap (ETFS) is ready to shoot for the moon, promising significant returns for early investors who recognize its value now. The Van Eck Bitcoin Expert's Forecast: A Bullish Signal For Investors Van Eck, a leading name in the crypto ETF space, holds considerable influence over investor sentiment. Known for its success in Bitcoin ETFs, the firm's expertise in the cryptocurrency market gives weight to any prediction made by its analysts. When a Van Eck Bitcoin expert forecasts a bullish run for both Ethereum (ETH) and ETFSwap (ETFS), it's not to be taken lightly. This is a Bitcoin expert whose insights carry considerable influence, and the market is already reacting. Ethereum (ETH) is a known powerhouse, but the fact that ETFSwap (ETFS) has been included in this forecast speaks volumes about its future potential. For investors aiming to profit from the next crypto surge, the Van Eck Bitcoin expert's forecast is a golden opportunity. While Ethereum (ETH) may be too costly for many, ETFSwap (ETFS) offers an affordable entry point with significant upside. At just \$0.03846 in its ongoing presale, ETFSwap (ETFS) is quickly attracting investors eager to capitalize on this bullish prediction. Conclusion With the Bitcoin-friendly Van Eck expert predicting a bullish surge for Ethereum (ETH) and ETFSwap (ETFS), the time to act is now. ETFSwap's (ETFS) presale price of \$0.03846 offers a rare opportunity to get in early before this rising star hits the mainstream market. Smart investors are taking advantage of this moment, securing their stake in what could be one of the most profitable altcoin investments in the coming crypto ETF boom. Don't wait—invest in ETFSwap (ETFS) today and be part of this promising bullish run. For more information about the ETFS Presale: Disclaimer: TheNewsCrypto does not endorse any content on this page. - The ETH price failed to clear above the \$2700 mark recently, and faced a brief correction. - A considerable increase is possible, however it may pale in comparison to previous peaks. The price of Ethereum (ETH) has risen by 15% in the last two weeks, thanks to positive momentum that followed post interest rate cut by the U.S Federal Reserve. A number of cryptocurrencies are making a comeback and

trading in green as September comes close to an end, demonstrating that the market remains resilient. Bitcoin and Ethereum may see a significant price jump by the start of October, thanks to the positive trend and large Spot ETF inflows lately. On the other hand, the SEC postponed its judgment on the approval of options trading for Ethereum ETFs until November 10-11 on September 24. Moreover, the current bankruptcy procedures at Genesis Trading have coincided with a major Ethereum (ETH) liquidation. An anonymous creditor sold 12,100 ETH, worth over \$31.43 million, during the last three days. Noteworthy market ripples have been caused by the execution of this sell-off, which had earlier bought 114,502 ETH valued around \$358.19 million in August. Investors Optimistic However, analysts and traders have projected that Ethereum might see massive price increases due to strong weekly performance, institutional inflows, and historical October trends. A considerable increase is possible, however it may pale in comparison to previous peaks. But it doesn't discount the possibilities that this rebound may bring to the altcoin market as a whole and to Ethereum in particular. At the time of writing, Ethereum (ETH) is trading at \$2618, down 0.20% in the last 24 hours as per data from CMC. Moreover, the trading volume is down 7.88%. The price failed to clear above the \$2700 mark recently, and faced a brief correction. However, it found a short-term support at \$2563 level today. On the daily time frame, the Relative Strength Index (RSI) stands at 57.33, indicating a neutral trend. If the price manages to break above \$2700 level, then it will likely climb further to test \$3088 resistance level. Breaking above this level, will likely see price testing \$3269 mark. Conversely, if the bears take control and push the prices below the recent support level of \$2563, then the price will likely test the \$2448 support level. If price breaks below this level, then it will likely head towards \$2257 support level.

In a world where cryptocurrency markets are known for their unpredictability, Ethereum is making strides toward a \$2,600 target, reigniting enthusiasm in the crypto community. Meanwhile, Bitcoin Cash is maintaining stability at around \$310, navigating through the market's ups and downs. Amid these market fluctuations, BlockDAG is proving to be a stable and promising option. A recent AMA session unveiled a new mining rewards program, set to distribute approximately 300 million BDAG coins monthly to miners. This initiative has driven miner sales up, with total units sold crossing the 12,300 mark making over \$4.9 million. Ethereum's Rising Prospects: Can It Reach \$2,600? Predictions for Ethereum's price in 2024 show a promising upward trend, potentially reaching \$2,600 in the near term. Analysts remain positive about Ethereum's ability to exceed its previous peaks. However, its rising value could lead to higher gas fees, though efforts to alleviate these costs are in progress. This increase could impact transaction expenses, and while the price of Ethereum might climb, its inherent volatility remains a risk for those looking for quick gains. Bitcoin Cash Sees Modest Improvement: A Sign of Recovery? Bitcoin Cash has experienced a slight 2% increase in its daily price, suggesting a potential for recovery. Despite this small gain, the broader volatility of the crypto market continues to prevent it from surpassing current resistance levels. Optimism still exists among some market participants who believe Bitcoin Cash could climb again, especially if it maintains support around \$287. Although it has declined by 12% this month, a push past the \$368 mark in upcoming weeks could signify a turnaround for Bitcoin Cash. BlockDAG's Latest AMA Drives Miner Sales to Over 12,300 Units BlockDAG's second AMA session, hosted by CEO Antony Turner, has significantly heightened interest in its mining operations. During the event, Turner highlighted the advantages of engaging early in the mining process, particularly with the company's new reward structure which distributes 300 million BDAG coins monthly. With the reward amount set to decrease over time, those who start mining early are poised to gain the most. This announcement sparked a rapid increase in miner sales, with more than 12,300 units sold, generating over \$4.9 million. The BlockDAG X1 Miner, a mobile app that allows users to mine up to 20 BDAG coins daily, has become particularly popular among newcomers. For those seeking greater mining output, the X10, X30, and X100 mining devices offer the capability to mine up to 2,000 BDAG coins each day. The focus on making mining accessible has attracted a diverse group, from beginners to experienced miners, boosting BlockDAG's community and positioning it for long-term success. Additionally, BlockDAG's presale achievements have bolstered its market position, with over \$76 million raised by selling more than 13.1 billion BDAG coins in just a few months. This success has propelled the price of BDAG coins up by 1820% from its initial presale price of \$0.001 to \$0.0192 in the latest batch. Evaluating Crypto Opportunities While Ethereum shows promising growth with a target price of \$2,600, Bitcoin Cash struggles to maintain stability, fluctuating around \$310 due to ongoing market volatility. In contrast, BlockDAG offers a unique and potentially more rewarding scenario, especially with its latest AMA revealing substantial rewards for early miners. These incentives have driven miner sales to a notable \$4.9 million from over 12,300 units sold. BlockDAG's swift progress and consistent reward payouts position it as a compelling option for those seeking stable returns in the crypto realm. Early participants in BlockDAG's mining program can maximize their gains as the monthly distribution of BDAG coins is expected to decrease over time. Learn About BlockDAG - Act Now Before Prices Increase: - Presale: <https://purchase.blockdag.network> - Website: <https://blockdag.network> - Telegram: <https://t.me/blockDAGnetwork> - Discord: <https://discord.gg/Q7BxghMVyu> Disclaimer: TheNewsCrypto does not endorse any content on this page. - Ethereum ETFs struggle with outflows, led by Grayscale's significant \$80.6M decline. - ETH outperforms Bitcoin with a 14% weekly rise, despite ETF outflows. Ethereum (ETH), the second-largest altcoin, has garnered attention with its volatile performance. After hitting a 27-day high earlier this week, ETH has seen a modest decline of 0.97% in the past 24 hours. Despite this, it remains up 14% over the past seven days. However, community sentiment remains 74% bearish, raising concerns about Ethereum's future trajectory. A key factor fueling these concerns is the significant outflow from

Ethereum ETFs. Since their debut on 23rd July, ETH ETFs have struggled to keep pace with Bitcoin counterparts. As of 23rd September, ETH ETFs recorded a cumulative outflow of \$79.3 million—the largest single-day outflow since 29th July. Meanwhile, Grayscale's ETHE led these outflows, reporting a staggering \$80.6 million decline. Other major ETFs, such as BlackRock's ETHA and Bitwise's ETHW, showed little to no inflows, with ETHW being the exception, posting a modest \$1.3 million inflow. Overall, ETHE's large outflow has tipped the net flows into negative territory. In terms of total flow, BlackRock's ETHA remains the leader with inflows of \$1.03 billion, while Grayscale's ETHE has seen outflows of \$2.84 billion since its inception. What Can Traders Expect From ETH? Despite the ETF outflows, Ethereum itself has demonstrated resilience. On-chain data reveals increased activity among large holders, with transactions above \$10 million growing by 21% over the past month. And the daily RSI stands at 51, showing that it is in a neutral position. Technical indicators such as the Directional Movement Index (DMI) suggest continued bullish momentum. If demand holds, ETH could break resistance at \$2,871 and push toward \$3,104. However, slowing accumulation could lead to a drop in price to the support level of \$2,582. As Ethereum navigates these pivotal resistance levels, its ability to sustain momentum will be crucial. Traders and investors are closely monitoring for signs of continued strength or potential reversals in the coming days. Highlighted News Of The Day Is Sui (SUI) Price Setting its Track for a Massive Bull Run?

- The SEC has delayed its decision on Ethereum ETF options. - Analysts believe Ethereum ETF options could boost liquidity if approved. The U.S. Securities and Exchange Commission (SEC) has once again postponed its decision on options trading for Ethereum ETFs, extending the deadline until mid-November. This decision impacts both Nasdaq ISE's proposal for BlackRock's iShares Ethereum Trust and NYSE American LLC's proposal for options trading on Grayscale's Ethereum ETF, alongside other Ethereum-based products. This delay follows the SEC's recent approval of Bitcoin ETF options. While the approval of Bitcoin ETFs has bolstered investor confidence in Bitcoin, Ethereum's fate remains uncertain. The SEC has stated it needs more time to evaluate the proposed rule changes, leaving investors waiting for clarity. On Monday, following the delay announcement, the Ethereum ETF market witnessed its largest net outflows since July. The outflows suggest that some investors are cautious about the SEC's prolonged decision-making process and its potential impact on the market. SEC's Decision Sparks Market Uncertainty Despite this uncertainty, optimism remains. The approval of Bitcoin ETF options has set a positive precedent that could bode well for Ethereum in the future. Analysts believe that should the SEC approve options trading for Ethereum ETFs, it would significantly boost liquidity in the market and attract a broader range of institutional investors. This would make it easier for both retail and institutional players to gain exposure to Ethereum, thereby enhancing its position in the financial ecosystem. The SEC's delay also underscores the growing demand for cryptocurrency-based investment products. Both retail and institutional investors are increasingly looking to diversify their portfolios with digital assets like Bitcoin and Ethereum. BlackRock's iShares Bitcoin Trust has already gained momentum, and many expect Ethereum to follow suit if it receives the SEC's nod. The new deadline for a decision is set for mid-November, and the market remains poised for further developments in the crypto-ETF landscape. Highlighted Crypto News Today Vitalik Applauds Celo as Its Stablecoin Adoption Surpasses Tron

The recent drop in Ethereum's price has caught the attention of many, declining significantly over a short period. This decrease has brought some uncertainty within the Ethereum community. Meanwhile, Cosmos (ATOM) faces its own challenges, floating near important support levels that could determine its future direction. Amid these cautious market vibes, BlockDAG introduces a spark of excitement in the crypto mining field. In a recent AMA, CEO Antony Turner revealed how combining their X10 and X1 miners could increase mining earnings by up to ten times. This synergy has elevated BlockDAG's profile and promises exciting developments for those involved with their technology. What else can BlockDAG miners achieve? Ethereum's Recent Price Movement: What's Happening? Ethereum has seen a notable price drop, falling nearly 20% within a month. This decline has pushed Ethereum below important thresholds, causing concern within the community. The main reasons for the drop include decreased interest in Ethereum-based exchange-traded funds (ETFs) and increased sales by large holders. Despite the fall, certain technical signs suggest potential upcoming changes. The Relative Strength Index (RSI) is currently low, and some are closely monitoring for any new developments. If the market momentum shifts, we could see changes in Ethereum's price in the upcoming weeks. Persistent Challenges for Cosmos (ATOM) Price The price of Cosmos (ATOM) has been on a downward trend since its peak in 2021. Despite some temporary recoveries, it consistently struggles to exceed its previous highs. Currently, the price of ATOM is approaching a critical support zone at \$2.5. This level is crucial and could either mark a turning point or lead to further declines. At this moment, ATOM is trying to stabilize above this key support level. Many are closely watching this area as it could indicate what lies ahead. If this support holds, there might be a chance for recovery; however, if it breaks, ATOM could see further losses. Merge BlockDAG's X10 & X1: Up to 10x Boost in Mining Power BlockDAG is making big waves in the crypto mining world. CEO Antony Turner recently shared exciting updates about the X10 and X1 mining rigs during an AMA session. He explained that combining these two rigs could increase their mining power by up to ten times. This news has sparked a lot of interest among those looking for effective crypto mining solutions. Turner pointed out that the X10 rig is strong on its own, but when it's merged with the X1, its effectiveness skyrockets. This combination could significantly enhance mining efficiency and potential earnings for miners, catching attention worldwide. He also mentioned that the X10 isn't upgradable by itself; however, combining it with the X1 changes the game completely. This strategy can significantly increase the mining power, with potential earnings jumping from about \$10 per day with just the X10 to \$100 per day when combined with the X1, highlighting a dramatic boost in mining capability. This update has led to a surge in sales, with miner sales crossing \$5 million and presales reaching \$74.5 million. Those who got in early are in a great position to potentially see substantial benefits, making BlockDAG a key name in

the future of crypto mining. Final Thoughts In a market seeing significant moves like the recent dip in Ethereum's price and the uncertain position of Cosmos (ATOM), BlockDAG stands out as an exciting option for those involved in crypto mining. The combination of their X10 and X1 miners not only aims to boost mining efficiency but has already drawn a large crowd of miners. This effort is expected to increase the value of the BDAG coin, making it a notable choice for those looking into cryptocurrencies in 2024. With these innovations, BlockDAG is positioning itself as a smart choice in the crypto space, blending breakthrough technology with significant growth potential. - The Ethereum Foundation sold 200 ETH for 527,989 DAI, according to Etherscan. - In September, a total of 1,150 ETH, valued at \$2.8 million, were sold due to this big selloff. The sale of 200 ETH by the Ethereum Foundation on Monday has roused investor fears throughout the world. Market observers are scratching their heads since the crypto is riding out negative waves in the industry as a whole. And on-chain data has shown that the selloff occurred via two transactions. Even if risk assets have been appreciating due to recent macroeconomic developments, market data shows that Ethereum is still seeing massive withdrawals. People who trade and invest in cryptocurrencies often wonder what the future holds for the cryptocurrency with the second-largest market valuation. Ongoing Selling Spree Today, the Ethereum Foundation sold 200 ETH for 527,989 DAI, according to data from Etherscan, which was updated on September 23. In September, a total of 1,150 ETH, valued at \$2.8 million, were sold due to this big selloff. It is worth mentioning that the organization has been consistently selling ETH for the previous several days. According to the numbers, the most recent sale occurred just three days ago. The organization's associated wallet address was recorded as `0xd77a`. Global investors are worried about the Ethereum market's volatility and the subsequent selloff. Even if the Federal Reserve dropped interest rates by 50 basis points last week, Ethereum nevertheless had a weekly outflow of \$28.5 million, according to statistics from CoinShares. Investors' mistrust of the asset was further cemented by the \$145.7 million in outflows for the month. ETH, however, is trading in the green today, bucking gloomy market views despite the aforementioned selloff. With a 3% increase over the previous 24 hours, the price of Ethereum (ETH) was \$2,662 at the time of writing as per data from CMC. Highlighted Crypto News Today: Ripple Price Consolidates in Symmetrical Triangle for 1.5 Months: What's Next For XRP?

The crypto world is seeing some interesting moves lately. Ethereum's price has dropped amid talks of potential rate cuts by the Fed, sparking conversations about the future of decentralized finance (DeFi). Meanwhile, Monero (XMR) is also riding a wave of uncertainty despite strong technical indicators, slipping by 0.39% recently. Amidst these ups and downs, BlockDAG is capturing attention with its robust potential. BlockDAG is quickly becoming a key player in the crypto scene. Having raised nearly \$74.5 million in its presale, the launch of its Testnet has marked a significant step forward. This platform is attracting developers eager to build decentralized applications and NFTs on its sturdy blockchain. With such strong groundwork, BlockDAG is fast becoming a top crypto to watch, with projections soaring as high as a 30,000x ROI for early adopters. Ethereum's Latest Developments: A Mixed Bag While Ethereum has long been a cornerstone in the DeFi sector, it's currently facing some hurdles. Despite analysts' expectations of a DeFi surge with potential rate cuts, Ethereum's price has been struggling, currently sitting below \$2,500, far from its annual high of \$4,000. Analysts like Michael van de Poppe express concerns over its recent performance, noting a downward trend in its 50-day moving average and significant outflows from ETFs. What's Going on with Monero? Monero's situation is also stirring interest. Despite a generally positive outlook, the recent dip in price by 0.39% and an increase in trading volume indicates a battle between differing market forces. With its price holding steady between \$101 and \$115, Monero's technical indicators like RSI and MACD hint at a brewing period of uncertainty, suggesting a cautious approach for those keeping an eye on this cryptocurrency. BlockDAG Testnet Goes Live, Exciting Developments Underway BlockDAG has taken a big step forward by launching its Testnet, which is great news for everyone involved in the project. This launch is key for developers looking to create decentralized applications (dApps) and mint NFTs, showcasing just how versatile the BlockDAG blockchain is. For those holding more than 7,500 BDAG coins, this launch means they can now move their coins from the Devnet to the Testnet. This gives them access to cool tools like the BlockDAG Explorer, which lets users track transactions, check out block details, and interact with the blockchain in real time. It's a robust platform that provides everything developers need to deploy smart contracts, mint NFTs, and even stake coins. For early supporters of BlockDAG, the Testnet launch isn't just a technical milestone—it's a chance to see the coin's utility grow. The presale of BDAG coins has been a hit, drawing nearly \$74.5 million and showing just how much demand there is for these coins. Those who got in early have seen a significant increase in the value of their holdings. Equally, market forecasts highlight a likely 30,000x ROI for early entrants in the long run. In September, BlockDAG has climbed to batch 23 with a price of \$0.0192, delivering early participants 1820% ROI. Following the testnet release, whales are diving in, stacking up their holdings. The Road Ahead While other cryptocurrencies like Ethereum and Monero are experiencing some fluctuations, BlockDAG is on the rise. Its Testnet is now live, making it easier than ever for developers to build out their projects on this platform. Unlike Ethereum, which is struggling to maintain the \$2,500 mark, and Monero, which recently saw a minor price dip, BlockDAG stands out as a compelling choice in the crypto world. The project's rapid \$74.5 million presale success and the strong demand for BDAG coins show it's on a solid path. Join BlockDAG – Act Now Before Prices Increase: - Presale:

- Ethereum is showing a steady recovery with a recent price increase, while closely tracking Bitcoin's movements. - Significant whale activity and institutional inflows indicate heightened interest and potential volatility. At the time of writing, Ethereum (ETH) is trading at \$2,676, reflecting a 3.10% increase over the past 24 hours. This surge is accompanied by a robust trading volume of \$15 billion, marking a significant 46.85% uptick. In the institutional space, US spot ETH ETFs recorded a daily net inflow of \$2.87 million, with total assets reaching \$6.92 billion as of September 20. Notably, the Grayscale Ethereum Mini Trust was the only ETF to see this inflow, as others reported zero activity. On the blockchain, significant movements are happening as Ethereum whales transfer assets. In the last five hours alone, 71,549 ETH have changed hands, alongside a notable deposit of 8,510 ETH, valued at approximately \$21.9 million, from a Genesis Trading bankruptcy wallet to centralized exchanges. 24 Hours ETH Technical Analysis: The current market capitalization stands at \$322 billion, also up by 3.225%. Despite a slight decline from its August 26 peak of \$2,735, ETH is showing signs of a steady recovery and may soon break the crucial \$2,700 barrier. However, Ethereum's trajectory remains closely tied to Bitcoin (BTC), currently trading at \$64,142 after a 0.64% decrease. This correlation suggests that movements in BTC are likely to impact ETH and other cryptocurrencies. The current market sentiment reflects this uncertainty, with 24% of the community feeling bullish while a significant 76% lean bearish. The resistance level is set at \$2,677, with nearby support at \$2,527. The longest-standing support level is located at \$2,279. Technical indicators paint a mixed picture. The Relative Strength Index (RSI) is at 76.37, indicating that ETH is in the overbought territory, while the moving average stands at 69.51. Additionally, the moving average cross data reveals a 9-day MA of 2,606 and a 21-day MA of 2,571, hinting at a potential bearish crossover as these averages converge.

A Satoshi-era Bitcoin whale who has a history of holding early Bitcoin where the entire crypto started, has recently revealed what three altcoins he prefers for the long term, and it is surprisingly not including Ethereum. Rather, this whale's portfolio is concentrated on Rexas Finance (RXS), Toncoin (TON), and Solana (SOL) all with different potentials for growth and solid fundamentals. Rexas Finance (RXS): An Emerging Star With Real-World Use Cases The trading price of Rexas Finance, which is currently in its second stage presale, is placed at \$0.04. The Token is still at a nascent stage of development; however, it still managed to capture the attention of investors and industry professionals, owing to its novel approach towards RWA Asset Tokenization. Because of this, Rexas Finance stands out amongst a few such projects that manage to merge the virtual and the physical world, allowing for real estate, art or any other real asset to be fractionally owned through the use of tokenization. Some of the core competitive edges of Rexas Finance are: Asset Tokenization: Investment in traditionally illiquid assets is made possible through the ease of trading them on the blockchain which Rexas Finance offers. Defi Tools and Ecosystem: In aspect of this matter, the platform also features a token builder and a launchpad for simple tokenization Strong Incentives: The project is now organizing a \$50,000 USDT giveaway promotion and encourages participants to gain bonus entries by completing different quests which will increase the community's support and participation. Rexas Finance is attracting early investors who are already bullish about the real use cases and the DeFi opportunities the project is going places with such a strong base and such amazing motivators. Toncoin (TON): Web3 and Cross-Chain Vision The price of Toncoin (TON) currently trades at about \$5.70 and for sure is one of the evolution of Web3. The whole idea of Toncoin was first initiated by Telegram and now it has become the core of the community, thus, Toncoin has become a pioneer of DApps, smart contracts, and cross-chain swap technology. The focus of the Toncoin ecosystem is to develop the areas of connecting all chains and cross-chain asset transfer. What makes Toncoin stand out: Web3 development: Toncoin has accomplished decent progress in the creation of DApps and services of the next-generation internet which is still elusive. Strong Community with Developer Network: Adding development and continuing with a burning community, Toncoin is making progress in extending its ecosystem further. Scalability and Speed: Fast transactions with very small costs are offered by Toncoin which is very beneficial for both developers and users. The evolution of blockchain technology helps the development of Toncoin's cross-chain functions and Web3 orientation so that the company will account for much of the market in the years ahead. Solana (SOL): The High-Performance Blockchain For \$138, Solana has already demonstrated the capacity to scale as it can process thousands of transactions within a second and at a very small cost. It is currently one of the fastest blockchains supporting DeFi, dApps, and NFT services which offer fast, cheap, and efficient scalability. Due to the explosive growth of web3 traffic, many developers flock to Solana and many people praise the comfort of decentralized apps on this chain without congestion, which is a common issue on many blockchains including Ethereum. Such high levels of scalability seen in Solana are one of the reasons for both institutional and retail investors' flows into Solana. Why Solana still rules: Unmatched Efficiency and Amount of Fees: The basic reason why users do not have latencies during their interactions with DApps when they are using Solana is the fact that there is high throughput in the efficient operation of the system. NFT and DeFi Boom: Over the past year, however, the Solana blockchain has evolved into one of the leaders, plunging into the versatility of NFT and DeFi space with a plethora of projects being launched. Developer-friendly Environment: The perquisites of the Solana framework are primarily for developers, which triggers the development of new extreme dApps. As the developer community is migrating toward Solana due to its performance benefits, the blockchain is likely to maintain this momentum, to consolidate its place as a top ten cryptocurrency

within the space. For what reason does the Whale Opt for These 3 Altcoins It is the guided strategic thinking that drives this Bitcoin whale to consider Rexas finance, Toncoin, and Solana after Bitcoin. The reason for this optimism is that every one of these tokens has something unique that will be in line with the anticipated advancements in the field of digital currencies. Rexas Finance is focused on a new area – tokenization of physical assets and provides a new trend on how traditional assets can be unlocked and further blockchain and crypto mass adoption can exist. Toncoin can respond to this trend and provides Web3 applications and cross-chain solutions which are undeniably the future of the multi-cross-chain ecosystem. With its well-known scalability and affordable fees, Solana continues to outrank the DeFi and NFT space, providing confidence in its potential growth in the longer term.

Conclusion In the crypto market, looking out for long-term winners can be a daunting task but one can look out for disproportional returns on investment by examining long-term strategies of investments that look at projects with real utility, strong fundamentals, and active development teams. The enormous potential of these projects is underlined by this Satoshi-era whale faith in Rexas Finance, Toncoin, and Solana. Except for the ability to change their perspective on the market and try new ideas, taking risks in this specific area is replete with hazards – these three altcoins however give genuine hope to long-term prospects. It doesn't matter if your goal is to invest in a market that has exposure to various assets or simply looking for a market opportunity then these tokens – Rexas Finance, even more so at the presale price of \$0.04, are very attractive.

- The US Spot Ethereum ETF saw a \$5.24 million inflow, primarily from Blackrock. - Ethereum's price of \$2,542.80 indicates strong market sentiment. Ethereum itself is witnessing a bullish trend, with large wallet transfers and increased trading volumes. As of September 19, the US Spot Ethereum ETF has shown significant movement, with a daily net inflow of \$5.24 million, primarily from Blackrock's ETHA, which recorded the entire inflow. The ETF now boasts total net assets of \$6.70 billion, and cumulative net inflows have reached \$610.35 million. However, most competing funds saw no inflows during this period. The bullish trend in the cryptocurrency market has prompted substantial transfers of Ethereum and Bitcoin. In just the past 20 hours, nearly 230,000 ETH were moved between various wallets. Notably, Galaxy Digital withdrew 3,500 ETH from Binance, bringing its total holdings to 65,368 ETH. Additionally, the Ethereum Foundation has also been active, selling 950 ETH valued at approximately \$2.27 million since the beginning of September.

Ethereum Price Analysis: Currently, ETH is trading at \$2,542.80, reflecting a 4.53% increase in price. Market sentiment remains positive, with a total trading volume of \$19 billion, although this represents a 5.75% decrease. The overall market capitalization of ETH stands at \$306 billion, up 4.49%. From a technical perspective, the first support level is identified at \$2,436, while stronger support lies at \$2,253. The first resistance is currently set at \$2,561, with a secondary level at \$2,520. The Relative Strength Index (RSI) is at 72.62, indicating that Ethereum is in the overbought territory, suggesting a potential sell signal. The moving average data supports bullish momentum, with the 9-day MA at \$2,474 surpassing the 21-day MA at \$2,390. In summary, Ethereum is experiencing a dynamic phase marked by significant inflows into ETFs and heightened trading activity, indicating robust market interest amid cautious sentiment about potential overextension.

Highlighted Crypto News Today: Jump Crypto Unveils –Frankendancer™ Validator on Solana Mainnet

- Commerzbank offers crypto trading services via Crypto Finance. - The service will start with Bitcoin and Ethereum, aimed at specific corporate clients of Commerzbank in Germany. Commerzbank, Germany's second-largest bank by branches, has partnered with Crypto Finance, a subsidiary of Germany's largest stock exchange operator, to provide crypto trading services for its corporate clients. According to the announcement, this move will initially focus on Bitcoin (BTC) and Ethereum (ETH), allowing businesses to easily and securely engage with these digital assets. Commerzbank, one of Germany's leading financial institutions, has been steadily advancing its involvement in digital assets. This partnership is seen as a major step, as it signals Commerzbank's commitment to offering its clients secure access to the growing cryptocurrency market. With this new service, corporate clients will have the ability to trade various digital assets, further integrating crypto into the mainstream financial ecosystem.

Strategic Moves to Enhance Crypto Services in Europe This partnership follows a series of strategic moves by Crypto Finance. Recently, the firm expanded its offerings by integrating crypto custody solutions and securing regulatory approval from Swiss authorities. As part of Deutsche Börse, Crypto Finance is leading institutional crypto adoption in Europe. Additionally, it has signed a similar agreement with Zürcher Kantonalbank (ZKB) in Switzerland. Further, this news comes after DZ Bank announced plans to test retail crypto trading in February. Commerzbank has been increasing its involvement in the digital asset space since obtaining a crypto custody license in November 2023. This license allows the bank to offer expanded services in digital asset management for corporate clients.

Highlighted crypto News Today Solana (SOL) Price Surges Amid Exciting Smartphone Announcement

In the ecosystem of cryptocurrency, the notion of various tokens making frenzied movements in price at the presale phases is revered. The latest Ethereum presale token which is priced below \$0.10 has attracted the attention of crypto whales indeed. However, as is common with dynamic assets, the excitement surrounding them goes beyond just the low price of entry. There are also promising characteristics of the asset that suggest that by Q1 2025, the token might be worth over \$50. Some specialists are even more optimistic about price advancements predicting increases of 5000%. It is timely to ask, what makes this token unique, and how can its dispositional innovations spark an explosive growth rate in a short time.

Real World Asset Tokenization (RWA) This token has been enhanced by focusing on one of the aspects of one of the most explosive potential Real World Assets or

RWA tokenization. RWA is a relatively new notion that promotes the ability to transfer physical entities such as real estate, goods, or even artworks onto blockchain networks. This token extends to users a platform whereby they can easily tokenize their assets thus allowing fractional ownership and access to markets that were previously not available to others. For example, Rexas Finance has demonstrated how disruptive RWA synthesis could be. This trend could increase the value of the token by hundreds of billions if it can faucet conventional markets that merge well with the decentralized and efficient features of the blockchain. Tokenizing real-world assets means that investors do not only speculate on a crypto project; they are investing in a hybrid business model that incorporates both conventional and crypto investments. Leaning Towards Decentralized Finance (DeFi) Increasingly. Apart from RWAS, tokens are also perfect within the comprehensive DeFi domain, as they allow their holders to use such services as lending, staking, and yield farming. There is no need for middlemen which has greatly improved the way people used to handle the financial aspects by making other intermediaries excessive and reducing the cost per transaction. Therefore, in such a growing trend toward decentralization of financial services, this token is perfectly positioned to take a considerable slice of the cake. Rexas Launchpad and Fundraising Potential The token has deep relations to platforms such as Rexas Launchpad since new projects can efficiently raise funds by issuing the earned tokens. Over time launchpads have become a very vital concept in the world of crypto as they offer a way for upcoming projects to present themselves and be funded. The composition presale token with such a launch pad permits it to have incursion of new projects which are then integrated into the outline thus creating more utility and increasing demand. Integrating AI with NFTs One more aspect that makes this token unique is its collaboration with NFTs (non-fungible tokens) and AI-based applications. The help of Rexas GenAI token, also helps in the creation of frangible assets, from images to items that can be tokenized, sellable, and cash-making. Furthermore, the additional incorporation of sophisticated AI systems that can generate unique NFTs is likely to attract various interest groups, from artists and investors to developers and collectors. This enhances additional possibilities for the owners of the tokens and extends the scope of application outside the conventional popularity of cryptocurrencies. Successful Presale Stage and What It Means for Growth in the Future Perspectives Especially for the stage of the presale, such stages are most often rough cut as to what the performance of the token is likely to be in the future. This presale token which is on the Ethereum network has been well received with plenty of crypto whales coming in to grab huge portions. Such early-stage participants are usually great opportunists and can spot well-rated projects, thus their heavy participation is a good pointer to the success of the token in the future. At this moment, the token is less than \$0.10, presenting a very interesting area for speculative investors who are after quick profits. Considering the hype created by the presale on many crypto social networks, it is safe to say that the initial performance in the market will likely be good. The early investors have much to gain if the token can pick up more and more interest before its full release. They are generally positive but other timelines are specific to a few portions, mostly the optimistic ones, for example, at the end of Q1 2025 it is reasonable to speculate the token might gain by 5000%. Such a rise would make the token bankable in the crypto industry. These forecasts are mainly based on the intended initial price, simple and extensive service range, and increasing market needs of such instruments. What Drives the Thesis of the Token in its Growth Potential Suffice it to say, that what makes this token attractive is not only its impressive presale but the actual innovation that drives its growth. The token is at the center of the many growing industries thanks to the integration of blockchain itself, real-world asset tokenization, DeFi-focused applications, and AI-driven NFT. - Market Access and Global Liquidity Real-world assets are brought closer to users via the token through the realization of markets that previously seemed inaccessible. This applies mostly to the real estate, commodities, and collectibles parts of the economy where the distribution and circulation are not easy in a global context. With such technology, these assets can be exchanged throughout the day without a pause and this allows the investors regardless of their size to own equity in the assets. - Fractional Ownership Another critical innovation is the token's facilitation of fractional ownership. Investors do not have to buy whole properties anymore, entire works of art, or any other valuable belongings. They can buy a portion of those assets through tokenisation which brings down the barriers to entry. This encourages many people to invest including the general public and institutions in turn increasing the propensity of the token. - Blockchain's Transparency and Security The transparency and security barriers brought forth by blockchain technology should not be undermined. Every detail regarding all kinds of transactions of the token is available on a public platform which implies that transfer of assets, performance of smart contracts reposting, and all related activities are subject to controlled execution and without interference. This lowers the chances of scam events occurring, brings higher levels of confidence among investors, and aids the long-term success of the token. Will the Token Be Able to Gain 5,000% in Value? How reasonable is the 5,000% surge by Q1 2025 with all the unique features in place and a successful presale stage? The caretakers of any crypto asset cannot easily chart its course churn for the unpleasant because the building blocks for exponential growth are certainly in place. It's a token that can onboard real assets onto the blockchain, it's diversifying with DeFi, and it's novel approaches to NFTs and AI work towards ensuring that this token maintains demand over the long term. Given the trend in this market whereby the value of assets goes up and considering the rate at which people are looking to recycle their wealth through the form of tokenized assets, a 5,000% increase is not too much of an expectation. The next few months will be crucial as this token moves from presale to being fully traded on the market but for now, all appears to be well for this under \$0.10 Ethereum presale token. The multi-strategy cryptocurrency investment company Cypher Capital has revealed that it is a part of a \$15 million initial fundraising round for Hemi Labs, a modular blockchain network that unifies

Ethereum and Bitcoin. Using funds from Cypher Capital, Hemi Labs will utilize the funding to develop and introduce the Hemi Network, advancing blockchain technology and improving interoperability via the creation of a unified supernetwork. The round follows the recent launch of Hemi's incentivized testnet and its planned mainnet launch in Q4 2024. Many investors have participated, including SNZ Holding, Binance, Breyer Capital, Big Brain Holdings, Crypto.com, HyperChain Capital, Alchemy, SALT Fund, Kelly Capital, Sunflower Capital, DNA Fund, Web3 Ventures, Quantstamp, TRGC, UTXO, Artichoke Capital, SV5, Impossible Finance, Jihan Wu (Bitdeer), and George Burke (Portal). Vineet Budki, CEO of Cypher Capital stated: "Hemi Labs is at the forefront of blockchain interoperability. Their approach to integrating Bitcoin and Ethereum into a cohesive supernetwork addresses key scalability and security challenges, and our investment aligns with their mission to transform blockchain infrastructure and unlock new possibilities for decentralized applications." Hemi Labs is developing a unified supernetwork, in contrast to previous attempts to integrate Bitcoin and Ethereum inside their own ecosystems. Hemi Network will include the Hemi Virtual Machine (hVM), which integrates an Ethereum Virtual Machine (EVM) with a complete Bitcoin node, enabling developers to create cross-chain smart contracts using well-known tools and guaranteeing compatibility with current EVM wallets and dApps. For sophisticated Bitcoin-native applications like staking and lending markets, the Hemi Bitcoin Kit (HBK) enables direct smart contract access to granular Bitcoin state. Additionally, the network has achieved Superfinality because of Hemi's Proof-of-Proof (PoP) consensus mechanism, which guarantees decentralized, permissionless security on par with Bitcoin and offers other blockchain networks Bitcoin security as a service. Hemi's Tunnels will enhance conventional bridge methods by providing trustless cross-chain portability. Hemi will also include password protection, time-lock, on-chain routing, and gasless transfers for smooth asset transfers without requiring native chain currencies. Jeff Garzik, Co-founder of Hemi Labs stated: "The quality and enthusiasm of our investors and partners reflect the groundbreaking nature of what we are building. We are well positioned to advance blockchain technology by creating a supernetwork that marries the capabilities of Bitcoin and Ethereum, and Cypher Capital's support is crucial to that success as they share our vision for the ecosystem."

- Ethereum L2 fees reduced to near zero, enhancing affordability. - Ethereum's transaction confirmation times significantly improved post-Merge. At Token2049 in Singapore, Ethereum co-founder Vitalik Buterin emphasized Ethereum's progress, notably highlighting reduced transaction fees and enhanced scalability through layer-2 (L2) networks. He celebrated the significant decrease in fees on L2s like Optimism and Arbitrum, which now stand at "basically zero," a vital development for mainstream adoption. "From being somewhere between \$10 and \$0.50 to under \$0.01. Rollups are finally affordable and becoming safer," Buterin remarked. Ethereum's gas fees, once exceeding \$200 during peak congestion, have significantly reduced thanks to L2 solutions. These networks help scale Ethereum by moving transactions off the mainnet. Reflecting on his past experience of paying over \$800 in gas fees for a single transaction, Buterin noted how L2 advancements have made Ethereum more accessible for day-to-day use. He also praised Ethereum's transition to proof-of-stake, known as "The Merge," which reduced confirmation times. It allows transactions to be processed in as little as 5 to 15 seconds. "Crypto Is Entering A New Phase" Buterin urged the crypto industry to balance mainstream usability with maintaining its core decentralization ethos. "We need to satisfy the needs of mainstream adoption, and we need to hold on to open-source and decentralization values," he said. Meanwhile, the conference also saw Vitalik Buterin challenge the belief that the crypto industry is still in its infancy. He argued that crypto, much like the internet, has moved past its foundational stage, entering a new phase where it is becoming more usable and poised for mass adoption. Despite regulatory challenges and price volatility, Vitalik Buterin's speech expressed optimism about crypto's future, emphasizing the industry's readiness for mainstream integration. The TOKEN2049 conference, which commenced on September 18, 2024, attracted global crypto enthusiasts, with Buterin's keynote being a key highlight. Highlighted News Of The Day SkyBridge Capital Founder Advocates for Kamala Harris Crypto Approach

- Google offers Ethereum RPC service to support blockchain developers. - Google simplifies dApp development by providing secure access to the Ethereum blockchain. Google Cloud has launched an Ethereum-compatible RPC service, enabling developers to build and scale blockchain applications on its platform. The service offers Ethereum developers a scalable infrastructure to deploy decentralized applications (dApps). RPC, or remote procedure call, is a crucial component of blockchain networks. Moreover, It allows developers to communicate with the Ethereum blockchain without running a full node. Google Cloud's new service will simplify this process by offering reliable and secure access to the Ethereum network. The service aims to offer low-latency access to Ethereum, ensuring that developers can efficiently interact with the blockchain. Enhancing dApps With Google's Blockchain RPC In addition, developers can leverage Google's security tools, analytics, and data management solutions to enhance their dApps. This integration helps companies build scalable applications while minimizing infrastructure management. "Google Cloud's Blockchain RPC offerings deliver fast response times " exactly what you'd expect from them," said Kyle Quintal, Head of Engineering at 0xArc. Earlier, on April 25, Google Cloud launched its Web3 Portal, offering blockchain resources like data sets and tutorials. The launch received mixed reactions, with critics pointing out its poor user interface and limited support for key blockchains like Bitcoin. The service aligns with the Ethereum JSON-RPC standard, simplifying integration for developers into their applications. It provides a complimentary tier that supports up to 100 requests per second and 1 million requests daily, enabling developers to create real-time and data-heavy applications without any expenses. Google Cloud's entry into blockchain infrastructure is expected to support developers across various industries, particularly those focused on decentralized finance (DeFi) and enterprise blockchain solutions. Highlighted Crypto News Today Bitget Exchange Surpasses 45 Million Users Globally

Ethereum has long been a heavyweight in the cryptocurrency market, but it's currently facing some challenges. Prices are having a hard time climbing past \$2,800, and over the past week, Ethereum's value has fallen by 6%, even after recovering slightly from lows between \$2,400 and \$2,500. Trading volumes have leveled off, but there's still a lot of worry in the air. As a result, investors, especially those holding large amounts of Ethereum, are starting to look for other options. BlockDAG is becoming a popular choice, catching eyes with its potential for huge returns. This piece explores the current climate for Ethereum, the rising interest in BlockDAG, its exciting partnerships, and the anticipation around its soon-to-come testnet launch.

BlockDAG: Catching the Eye of Ethereum Investors

BlockDAG is turning heads in the blockchain world, especially now, with its presale doing really well in August 2024. What's special about BlockDAG? It's built to handle a lot of transactions really fast and keeps things secure, fixing some big problems that other blockchains have. In August alone, BlockDAG's presale brought in over \$71 million, and the price per share shot up by 1680%, from just \$0.001 to \$0.00178. That shows a lot of investor confidence. What's more, a lot of the big-money investors from Ethereum are starting to put their money into BlockDAG, hoping it might grow even more. This shift shows that these investors are looking for new opportunities that could bring in 30,000x ROI.

Ethereum's Market Challenges: A Tough Week for Bulls

Ethereum is facing some tough times in the market. Even though the price seems stable day-to-day, it's actually dropped 6% over the last week. The problem? Ethereum can't seem to get past the \$2,800 mark, and more and more Ethereum is being moved to big exchanges like Binance and Coinbase. This usually means that people are getting ready to sell, which isn't a good sign. To make things worse, there's a "death cross" showing up on Ethereum's daily charts. This happens when the short-term average price falls below the long-term average, and it often means prices might keep dropping. Even though this is a bit of a delayed warning, it's making traders think twice. Despite all this, Ethereum is still a strong player in the long run, but right now, some traders are looking for other options.

Expanding Horizons: BlockDAG's Strategic Moves

BlockDAG is making big strides with its strategic partnerships. In August 2024, it teamed up with Borussia Dortmund, one of the top soccer clubs in Europe. This partnership means BlockDAG gets to connect with the club's huge global fanbase, helping boost its visibility and engage more people. BlockDAG didn't stop there. It also partnered with Inter Milan, becoming the club's Official Blockchain Partner. This deal lets BlockDAG place its brand on big screens and LED displays at home games and run joint social media campaigns. These steps show BlockDAG's effort to widen its reach and become a known name in mainstream sports.

A Big Step Forward: BlockDAG's Testnet Launch

Looking ahead, one of the most exciting things on BlockDAG's calendar is the launch of its testnet on September 20, 2024. This testnet will prove how well BlockDAG can handle big numbers of transactions quickly and safely. It's designed to be faster and more scalable than older blockchains like Ethereum, aiming to solve some of the biggest issues in blockchain technology today. The testnet is super important for BlockDAG's future. If it works as hoped, it could show that BlockDAG is ready to take on big roles in decentralized finance (DeFi) and other blockchain applications, drawing even more interest from big investors.

Why BlockDAG Is a Standout in the Blockchain Crowd

BlockDAG's growth isn't just about new technology—it's also about smart partnerships and timely launches. Its system is built to be faster and handle more transactions than traditional blockchains, which helps it stand out. Partnerships with well-known brands like Borussia Dortmund and Inter Milan also help it reach a broader audience. While Ethereum is still a big name in blockchain, its recent ups and downs have made investors look around for other options. BlockDAG has caught many investors' eyes with its strong technology, effective partnerships, and exciting upcoming testnet. With significant investments coming in from Ethereum whales in August, there's a lot of optimism around what BlockDAG can achieve. Everyone's now watching to see how the testnet goes—this could really confirm BlockDAG's place as a top blockchain platform.

- Whale transactions of over \$90 million signal potential market shifts.

- The Altcoin's RSI is neutral at 48, indicating consolidation. Ethereum (ETH) is currently trading at around \$2,312, slightly upward over the past 24 hours. However, recent fluctuations have kept traders on alert. Moreover, the much-anticipated Ethereum Exchange-Traded Funds (ETFs) could soon drive new institutional investment. These funds are expected to bring more capital into Ethereum's ecosystem.

In whale movements, Ceffu made a notable deposit in the past 24 hours. It transferred 28,865 ETH, worth \$66.74 million, to Binance. Ceffu's holdings now stand at 178,687 ETH (\$411 million). Additionally, another significant transaction saw 11,042 ETH, worth \$25.39 million, moved from an unknown wallet to Binance. Such large transactions often signal market moves ahead. With whales making significant deposits, traders are closely watching for potential price shifts.

Will ETH Break the Key Resistance?

Ethereum faces a key resistance level at \$2,350. If Ethereum manages to break above this resistance, it could trigger a bullish momentum, pushing the price toward the next resistance level of around \$2,400. The market appears relatively stable, and Ethereum is finding strong support near the \$2,300 level. If the price holds above this support, it could provide a foundation for potential upward movement. However, if the support level breaks, Ethereum may slide down to the next key support level around \$2,250, where buyers could step in.

On the technical front, Ethereum's RSI stands at 48, suggesting neutral momentum. The price is moving close to the 9-day simple moving average (SMA) of \$2,313, indicating slight consolidation. Volume has been moderate, with no major spikes in activity. Additionally, network performance remains robust, handling high transaction volumes without significant issues. Recent updates on Ethereum's scaling solutions are expected to improve network efficiency further. Meanwhile, Ethereum co-founder Vitalik Buterin continues to guide the project

forward. He has been vocal about the future direction of Ethereum, particularly in scaling and upgrading the network. However, with the market largely stable, investors are waiting for a stronger catalyst to push the price higher.

- Ethereum's price has dropped by 5.53%, now trading at \$2,285.68. - A whale purchased 5,615 ETH, totaling \$12.77 million, at an average price of \$2,274. Ethereum (ETH) is currently trading at \$2,285, marking a 5.53% decrease in the last 24 hours. Its market cap has dropped to \$275 billion, while trading volume has surged by 80.74%, reaching \$13.63 billion. The decline in Ethereum's price reflects broader market uncertainty, contributing to a sharp downturn in investor sentiment. Over the past 24 hours, Ethereum has experienced significant downward pressure, reflected in its growing trading volume. A major whale has entered the market amid this volatility. The on-chain analyst reported that an Ethereum whale, known for swing trading, has acquired 5,615 ETH worth \$12.77 million. The whale, whose address starts with 0xe0B5, made its seventh major trade, buying at an average price of \$2,274. This large purchase signals that some traders may view Ethereum's current price as an opportunity, despite its ongoing decline. Whale activity like this often hints at market positioning, but its impact on price is still uncertain. At the same time, the ETH/BTC rate has dropped to levels unseen since April 2021. According to Wu Blockchain, the ETH/BTC pair briefly touched 0.03985 on Binance, its lowest rate in over three years. This decrease in Ethereum's relative strength against Bitcoin may concern investors. The pair once peaked at 0.1238 in January 2018 but is now trending closer to its all-time low of 0.01615. Additionally, 13,977 ETH (around \$32.78 million) has been transferred to Coinbase, raising speculation about potential selling pressure in the coming days.

Ethereum (ETH) Technical Indicators From a technical perspective, Ethereum shows mixed signals. The Relative Strength Index (RSI), currently at 43.56, suggests that Ethereum is nearing oversold levels but still has room for further decline. Immediate support sits at \$2,275, with resistance around \$2,300. If Ethereum breaks below \$2,275, the next support could be around \$2,250. On the other hand, a move above \$2,300 could push the price toward \$2,325. Market participants watch these levels closely as the next move could define short-term trends. With whale activity increasing and technical indicators nearing critical points, Ethereum's market remains uncertain.

Highlighted Crypto News Today Coinbase Denies Giving Special Bitcoin Borrowing Privileges to BlackRock

Very few traders have the foresight to ride a cryptocurrency from its low to its peak, but when they do, it's worth paying attention. One expert investor who recognized Ethereum's potential, profiting as it soared from \$200 to nearly \$4,800, has now shifted focus to Rexas Finance, a promising new altcoin currently priced under \$0.10. With a keen eye for market-defining trends, this investor believes Rexas Finance is set to revolutionize the crypto market by bridging blockchain technology and real-world assets. Ethereum's Historic Rise Ethereum's journey from \$200 to \$4,800 remains a significant event in the crypto market. Few altcoins have experienced such a meteoric rise. Investors who saw Ethereum's potential early on reaped considerable rewards, and this investor was among the most successful. Ethereum is known for its decentralized platform, smart contracts, and widespread adoption across various sectors, including DeFi and NFTs. Now, the same sharp market instincts that led to Ethereum's success are focused on Rexas Finance, a project with similar disruptive potential.

Rexas Finance: Tokenizing Real-World Assets Rexas Finance, gaining attention in the crypto market, is actively reshaping how real-world assets are integrated into blockchain networks. Its core proposition lies in tokenizing real-world assets like real estate, gold, and other commodities. This allows anyone to purchase or sell fractional ownership of these assets with ease, transforming traditionally inaccessible markets into a global opportunity. Rexas Finance enables a person in one part of the world to own a fraction of a high-value asset like a property or business located anywhere else. Rexas Token Builder and Launchpad Rexas Finance offers several features that distinguish it from other projects. One standout utility is the Rexas Token Builder, which allows users to tokenize their assets without needing technical expertise. This tool simplifies the process, whether it's real estate, fine art, or even smaller assets like vehicles. Additionally, the Rexas Launchpad facilitates fundraising for new tokens, offering creators a platform to raise capital by connecting them with global investors. This is crucial as more people look to tokenize their assets and raise funds.

Rexas Estate and Utilities The Rexas Estate platform is another key feature, enabling users to buy and sell real estate in both full and fractional shares. Whether you're a large investor or a small one, this system makes entering high-value markets accessible, no matter where you're located. For instance, someone in Europe could purchase fractional shares of Tesla, benefiting from the company's growth and innovation in the electric vehicle market. This fractional ownership model lowers the barrier to entry, allowing smaller investors to participate in high-value industries they previously couldn't access. Other notable utilities include the Rexas Quickmint Bot, which speeds up the token minting process, and Rexas GenAI, an artificial intelligence tool that aids users in making informed investment decisions. With Ethereum being instrumental in advancing decentralized finance, Rexas Finance complements this by introducing AI-driven features to enhance user experiences. Rexas AI Shield further bolsters security, ensuring that tokens minted and traded on the platform are safe from fraud or tampering.

Tokenomics and Rexas Finance Presale Rexas Finance's tokenomics are structured for sustainable growth, with a total supply of 1 billion RXS tokens. The allocation includes 42.5% for presale, 15% for liquidity, and 22.5% for staking, among others. The project opted for a public presale rather than relying on venture capitalists, allowing retail investors to participate early. Stage 1 of the Rexas Finance presale sold out in just a few days, raising \$450,000, a testament to the strong demand. The presale is now in Stage 2, with tokens priced at \$0.04, marking a 34% increase from the initial stage. With nearly half of the available tokens in this phase already sold, momentum is building fast.

Conclusion: The Next Big Altcoin Rexas Finance is rapidly emerging as a game-changing altcoin in the crypto market, drawing comparisons to Ethereum's early days. With the backing of an investor who profited handsomely from Ethereum's rise, Rexas Finance stands poised to revolutionize the tokenization of real-world assets. For investors looking to capitalize on the next big

opportunity, Rexas Finance offers a compelling entry point at under \$0.10 per token. Disclaimer: TheNewsCrypto does not endorse any content on this page. Rexas Finance (RXS) is a surprise for investors looking towards the highly unpredictable world of cryptocurrencies. After once moving into Ethereum Operative Real World Asset (RWA) Tokenization, it is beginning to grow in the DeFi industry where it seeks to change how we manage and trade assets using innovative blockchain technology. The initial presale was offered at a price under \$0.10 per token and a receptive of demand previously unknown to Rexas Finance (RXS) has been extended in all directions. People are in a hurry to invest since it is said that Rexas Finance (RXS) can reach \$15 in 2025 and many believe this could be a game changer in the industry. The Surge in Demand During Presale While many crypto projects struggle during presales, Rexas Finance (RXS) attracted significant interest from both retail and institutional investors. Priced at \$0.04 in its second stage and approaching its third stage with the price projected to enter \$0.05, it was viewed as a long-term accumulation opportunity, leading to huge demand due to anticipated future price appreciation before its official release. Rexas Finance (RXS) has a strong and well-thought-out technological base as well as a clear vision for its future. The increase in demand for the RWA token arises from the opportunities and added advantages offered by the illiquid RWA assets. How RXS Aims to Hit \$15 by Early 2025. Rexas Finance (RXS) anticipates reaching \$15 by early 2025, driven by the expanding RWA tokenization market. With trillions in real-world assets yet untokenized, Rexas Finance (RXS) sees a vast market opportunity as industries increasingly adopt digital tokenization, transforming traditional assets like real estate into blockchain-based forms. Rexas Finance (RXS) intends to implement interfaces with leading DeFi platforms and exchanges, increasing reach and liquidity. Real estate and commodities institution partnerships will aid in the adoption of an easy-to-use RWA trading platform on Ethereum and will lower the barrier for investments hence making Rexas Finance (RXS) more attractive to wider investors. There is a ceiling on how many Rexas Finance (RXS) tokens are authorized for production, which means that whenever there is a higher demand, the value of the tokens will increase. This shortage is what the initial investors are looking to harness for capital appreciation. Real-World Asset Tokenization: The Next Big Thing in Crypto? Real-world asset (RWA) has grabbed significant attention for its tokenization dominated by projects like Rexas Finance (RXS). It helps to bring liquidity to once illiquid markets thus making it easier for more people and investors to participate and invest where before only a handful have access to. Since all intermediaries are cut off as a result of trade tokenization, trading costs are significantly less and there is increased transparency in the overall transaction process. For instance, tokenized real estate allows any person from across the globe to invest regardless of all intermediaries, while tokenization of bonds opens up previously monopolized markets to small investors. Risks and Considerations Despite the prospects of Rexas Finance (RXS), potential investors should however consider factors that involve risks that accompany investments in cryptocurrency. Rexas Finance (RXS) has continued to call potential users with its strong presale performance, but practically speaking, the price shall be subject to changing market conditions, and infrastructural regulation as well as emerging stiff competition from similar tokenization ventures. A key consideration for Rexas Finance (RXS) is the regulatory landscape of RWA tokenization. Varying regulations across countries on trading and ownership of tokenized assets could pose challenges, potentially creating roadblocks for Rexas Finance (RXS) in certain markets and affecting its broader adoption and growth trajectory. Conclusion Rexas Finance (RXS) is all set to shake things up in the world of crypto through its real-world asset tokenization and a successful presale. Forecasts suggest that Rexas Finance (RXS), currently under \$0.01 will hit \$15 by early 2025. Rexas Finance (RXS) has the potential to serve a major role in connecting traditional finance and decentralized finance. Those who are keen on making an early investment in what could be a potential innovation in blockchain technology can find Rexas Finance looking for you with a high-risk but equally high return on investment within the more familiar risks of the highly fluctuating cryptocurrency hub. For more information about Rexas Finance (RXS) visit the links below: Website: <https://rexas.com> Whitepaper: <https://rexas.com/rexas-whitepaper.pdf> Twitter/X: <https://x.com/rexasfinance> Telegram: <https://t.me/rexasfinance>

- Ethereum faces sustained bearish pressure with declining market volume and volatility. - Whales steadily accumulate ETH, indicating long-term bullish expectations. Ethereum, the leading altcoin, has experienced a sustained bearish trend, with a 14% decline in the past month. Currently trading at \$2,353, the cryptocurrency saw a modest dip of 0.31% over the past 24 hours, while its trading volume plummeted by 30%. This comes with the overall market volume dropping by 19%. According to Greeks.live, 127,000 ETH options are set to expire, with a Put Call Ratio of 0.73, a Max Pain point at \$2,400, and a notional value of \$298 million. Market volatility expectations are declining, as seen in the drop in major term implied volatilities. With the Federal Reserve expected to implement a 25 bps rate cut next week, the Max Pain point aligns closely with Ethereum's price. September has proven particularly weak for Ethereum, which continues to underperform. The ETH/BTC exchange rate fell below the long-term support level of 0.04, signalling that Bitcoin may remain the dominant force in the next bull market. In addition, Ethereum network fees dropped to \$3.1 million for the week ending August 31, the lowest level in over four years. Despite these challenges, whale investors have been steadily accumulating ETH, with their holdings approaching 48% of the circulating supply. A notable transaction saw 80,000 ETH, worth approximately \$187.5 million, transferred from Binance to Binance Beacon Deposit. Can ETH Bulls Give A Comeback? The daily chart shows ETH entrenched in a bullish trend, with Ethereum facing critical resistance at \$2,477 and \$2,678. Should bearish sentiment persist, ETH could fall to \$2,222, with potential support at \$2,102. As Ethereum navigates these key levels, its ability to sustain momentum will be pivotal in the coming days. Traders are closely watching for signs of strength or further declines. Highlighted News Of The Day

- Ethereum showed modest price increases in the last 24 hours as per CMC data. - The altcoin's daily trading volume showed a 10.43% increase. The crypto sector shook off its recent slump with a surge in activity over the last 24 hours. While the web3 ecosystem made several advancements, cryptocurrency prices took a turn towards a modest positive. Relatedly, the leading altcoin and second largest cryptocurrency, Ethereum recorded a 0.98% increase in daily price movements. Notably, ETH price movement showed entering a consolidation as prices stagnated at the \$2.3K level. As the overall cryptocurrency market also witnessed declining movements, Ethereum succumbed to the price slump. However, in the last 24 hours, with Bitcoin leading the aforementioned positive movement, the altcoin is also attempting to break the crucial resistance levels. On inferring the token's daily price chart, Ethereum, in the afternoon hours of September 11 traded at \$2,309. As the day progressed, the token propelled by Bitcoin's price movement attempted to surpass \$2,300 several times. However, at the time of writing, Ethereum was still trading at \$2,344 as per CMC data. Nevertheless, if the altcoin manages to sustain its current positive momentum, it may break out of the consolidation phase. Meanwhile, Ethereum co-founder, Vitalik Buterin was seen making ETH movements as per Arkham Intelligence data. A wallet connected to the co-founder staked 949.9 ETH tokens worth \$2.24 million onto the Aave network approximately 10 hours ago. Ethereum Price Weekly Overview According to TradingView data, Ethereum's weekly price performance stands at 4.27%. At the beginning of the week, the token was trading at \$2,412 before it slid downwards. Additionally, the token fell to the support of \$2,150 on September 6, which was also its weekly low. However, in the last 24 hours, as aforementioned, the altcoin has taken a positive turn. Moreover, Ethereum's 50-day to 200-day MA shows the occurrence of a death crossover, recently on August 8. Meanwhile, the token's Moving Average Convergence and Divergence (MACD) indicates a positive turn. The token's signal line crossed over the MACD line suggesting the recent upward movement. On the other hand, Ethereum whales have shown selling activity over the past few months as reported by market analyst Ali. Highlighted Crypto News Today: Attestant Signals ETH To Refine Messaging To Pull In Wall Street Investors

Ethereum is showing signs of recovery, with prices climbing and pointing to a possible market rebound. Cardano (ADA), despite bearish short-term predictions, is also hinting at a potential upswing. However, amidst these recoveries, BlockDAG is catching attention as a bullish crypto with high potential. Its advanced tech and ecosystem, set to launch its testnet on September 20, have sparked interest. Still in its presale phase, BlockDAG has outpaced many market leaders in terms of inflows and engagement. The project has raised over \$71.6 million, delivering profits up to 1680% for early backers. This success shows strong confidence in BlockDAG's future, making it a project that can potentially yield more than 30,000x ROIs to its holders. Ethereum News: A Closer Look at Price Movements Ethereum is currently in a consolidation phase, with prices stabilizing after the recent dip. At present, it remains below the key \$2,800 resistance level, giving sellers the upper hand. However, Ethereum bounced from the \$2,400 and \$2,500 support zones, offering hope for a potential rally. Over the past week, Ethereum has dropped 6%, but trading volumes have improved, standing at over \$12 billion. The short-term outlook remains uncertain, as technical indicators point to a possible downturn. The recent increase in Ethereum flowing into exchanges is a bearish sign, often linked to selling pressure. Despite this, a push above \$2,800 could spark a significant rise, with targets set at \$3,300 and \$3,500 if momentum builds. Ethereum's price movements are key for traders to watch. Cardano (ADA) Price Prediction: Current Outlook Cardano has faced a challenging market recently, slipping to 12th place in terms of market cap, behind assets like Dogecoin and Toncoin. Despite Charles Hoskinson's claims that Cardano could surpass Bitcoin and Ethereum, ADA now holds just 1% of Bitcoin's market cap, a significant drop from 10% three years ago. The much-anticipated Chang hard fork failed to boost Cardano's price, disappointing many in the community. Looking ahead, the Cardano (ADA) price prediction remains mixed. Prominent Bitcoin advocates predict that ADA could collapse by another 90%, questioning the project's long-term potential. Still, Cardano's development team continues pushing for innovation, keeping some optimism alive. However, ADA's position in the market remains precarious, and further downturns could be possible without significant updates or market shifts to reverse the current trend. BlockDAG Testnet Launch Date Closes In BlockDAG is gearing up for a significant milestone with the launch of its testnet on September 20, 2024. This marks an exciting step forward for the project, giving the community a first-hand experience of its blockchain's capabilities. With tools like the Blockchain Explorer, users can explore transaction details and test out smart contracts. Features like MetaMask Wallet integration and a blockchain faucet will also allow users to mint and transfer BDAG coins. This testnet release is a crucial moment, showcasing how far BlockDAG has progressed toward its mainnet launch. The upcoming testnet launch has generated excitement in the market, boosting the presale and attracting traders eager to see the technology in action. The high-tech roadmap and early access to BlockDAG's blockchain offer a preview of what's to come. With full EVM support, developers can test smart contracts and explore the platform's real-time transaction capabilities, positioning BlockDAG as a key player among bullish cryptos. The presale has already raised over \$71.6 million, and early backers have seen remarkable returns, with BDAG's price increasing by 1680%. This surge reflects the growing confidence in BlockDAG's long-term potential, as the project continues to outperform many established cryptocurrencies to give holders with potential 30,000x ROIs. The roadmap is designed for long-term growth, and the upcoming testnet is just the beginning. For those looking for a promising long-term asset, BlockDAG's strong presale success and innovative technology suggest a bright future ahead. Key Insights While Ethereum and Cardano navigate market uncertainties, BlockDAG's swift rise and innovation make it a standout in the world of bullish cryptos. With its testnet launching on September 20, the project is set to showcase its advanced blockchain technology, offering users a glimpse of what's ahead. The presale has already raised over \$71.6 million, delivering 1680% returns to early backers, and potential 30,000x ROIs in the long run. As Ethereum news highlights market volatility and Cardano (ADA) price predictions remain mixed, BlockDAG's strong roadmap and presale success position it as a promising long-term asset with huge potential for future growth. A renowned cryptocurrency analyst, known for accurately predicting Ethereum's (ETH) drop below \$900 during the 2022 crypto winter, has recently labeled a new rival to Solana (SOL) as a "must-hold". The analyst, active on X (formerly Twitter), had forecast Ethereum's decline after it peaked near \$5,000 in late 2021, a prediction that proved correct due to adverse market conditions intensified by events such as the FTX collapse. As the crypto market moves through its latest transformation, the spotlight is now on this emerging competitor, Rexas Finance. Launched on September 8, 2024, the real-world asset tokenization platform raised over \$200,000 in just the first 24 hours of its presale, demonstrating strong initial interest from investors. Ethereum's Fall to \$900 Ethereum, which approached a peak of \$4,891.70 in November 2021, experienced a dramatic fall to below \$900 by late 2022. This significant decline was influenced by a combination of factors including rising interest rates, which redirected investor interest, and the high-profile bankruptcy of the FTX exchange. The broader crypto market cooled off as a result, leading to Ethereum's sharp downturn. The market's slow recovery into 2023 and early 2024 has been marked by renewed optimism, partly driven by the approval of several bitcoin and Ethereum spot exchange-traded funds by the Securities and Exchange Commission. Solana's Struggle and Future Predictions Solana, which surged to an all-time high of \$260 in November 2021, has faced challenges in maintaining its upward trajectory. Although SOL reached \$200 earlier this year, hopes for a new peak have dimmed as the coin has experienced a downturn. The analyst from X (formerly Twitter) who foresaw Ethereum's plummet has suggested that Solana might fall further, with potential drops to as low as \$110. Rexas Finance Emerges as a Promising Investment Rexas Finance (RXS) has emerged as a significant new opportunity in the crypto market. Launched on September 8, 2024, Rexas Finance raised \$200,000 within the first 24 hours of its presale, highlighting strong early interest. The platform is revolutionizing the tokenization of real-world assets (RWA), converting physical assets like real estate and gold into digital tokens on the blockchain. The real estate market, valued at approximately \$379.7 trillion, and the commodities market, projected to reach \$121.2 trillion by 2024, present substantial opportunities for this technology. Rexas Finance allows users to buy and sell fractional ownership of real-world assets with ease, breaking down traditional barriers related to geographic location and high entry costs. This innovation not only enhances liquidity but also reduces transaction costs, promoting a more inclusive economic landscape. Comprehensive Features of Rexas Finance Rexas Finance incorporates several key features designed to enhance the tokenization process and provide comprehensive solutions. The Token Builder enables users to create and launch their own tokens without coding knowledge, supporting various standards like ERC-20 and ERC-721. The QuickMint Bot, integrated with platforms like Telegram and Discord, facilitates instant token creation through simple commands, allowing rapid market entry for new projects. Rexas Estate focuses on the tokenization of real estate, facilitating fractional ownership and improving liquidity in property investments. GenAI, an AI-driven platform, assists in creating and managing NFTs, offering tools for artwork generation and marketplace integration. AI Shield provides enhanced security for smart contracts through AI-powered audits and real-time monitoring. Additionally, the Treasury and DeFi components of Rexas Finance include a multi-chain yield optimizer and services like yield farming and staking. The Launchpad supports new cryptocurrency projects with tools for fundraising and community building, ensuring transparency and thorough project evaluations. Rexas Finance's Stage 1 presale is underway with tokens priced at \$0.030 each, increasing to \$0.040 in the subsequent stage. Furthermore, a \$1 million giveaway is also in the works to drive investor engagement. The tokenomics of Rexas Finance include 42.5% allocated to the presale, 15% to liquidity, 10% to the treasury, 22.5% to staking, and smaller portions to marketing, the team, giveaways, and partners. Rexas Finance is dedicated to community involvement. While the project could have been easily launched with VC funding, it chose a decentralized approach to include everyone. Additionally, early investors stand to gain returns of at least 600% as the RXS token launches. Looking Ahead With its innovative approach to bridging real-world assets and blockchain technology, Rexas Finance is positioned as a significant player in the crypto market. The platform's comprehensive feature set addresses key gaps in liquidity, transaction complexity, and regulatory compliance, setting the stage for substantial growth. Rexas Finance (RXS) stands out as a "must-hold" investment for those seeking to engage with the future of digital assets. Disclaimer: TheNewsCrypto does not endorse any content on this page. - Ethereum's price drops 1.32%, trading at \$2,337.21 amidst significant market activity. - Ethereum ETFs see \$11.44M inflow after five days of net outflows. Ethereum is trading at \$2,329, according to CMC data, reflecting a slight decrease of 1.32% over the last 24 hours. Ethereum, the second-largest cryptocurrency by market capitalization, has faced notable pressure amid broader market corrections. With Ethereum's network still being the backbone of decentralized finance (DeFi) and NFTs, price fluctuations continue to impact its position in the market. Despite this, the Ethereum network's fundamental use case keeps its long-term outlook resilient. A notable whale activity was recorded recently when 89,600 ETH, worth approximately \$208.6 million, was transferred from Binance to Binance Beacon Deposit. Large-scale transactions like this often signal either institutional movements or strategic staking, which might affect market liquidity. Additionally, in the past week, ETH holders deposited a substantial 312,183 ETH (valued at \$751 million) into exchanges. This sharp increase in exchange deposits signals a growing sense of uncertainty and potential selling pressure from market

participants. Ethereum's spot ETFs have also seen a significant development. On September 10, Ethereum ETFs experienced their first net inflow after five days of outflows. The total net inflow reached \$11.44 million, with Fidelity's FETH contributing \$7.13 million and BlackRock's ETHA adding \$4.31 million. This shift in ETF inflows could indicate renewed investor confidence in ETH despite the current market volatility. Can Ethereum Surge Past the Key Resistance? Technically, ETH faces crucial support at \$2,223, with resistance at \$2,541 and \$2,773. The Relative Strength Index (RSI) is currently at 39.77, indicating that ETH is nearing oversold territory. The RSI average stands at 38.55, showing a slightly bearish trend. Ethereum's moving average hovers around \$2,345, highlighting price stagnation. Market cap has reduced by 1.32%, dropping to \$28.23 billion, while market volume has also decreased by 10.69%, totaling \$13.51 billion. The market cap ratio stands at 4.90%, reflecting reduced trading activity compared to market capitalization. Ethereum's current market sentiment reflects a mix of bearish signals, growing uncertainty, and potential support from ETF inflows. Investors are closely watching technical indicators and whale movements, which will likely determine short-term price action. Highlighted Crypto News Today Vitalik Buterin Wallet Offloads Another 190 ETH for USDC

- Ethereum price slips into the \$2.3K range, with a brief 1.52% spike. - ETH hits a 4-month high in network growth with 126,210 new wallets. Altcoins have shown mixed signals this week, with Ethereum, the largest altcoin, grappling to hold its ground. Its price remains caught between crucial support and resistance levels, recently dropping below \$2,400. Notably, over the past 24 hours, despite price fluctuations, ETH witnessed a moderate spike of 1.52%. At the press time, ETH traded at \$2,351 with a market cap of \$282 billion. Over the day, Ethereum recorded the lowest price at \$2,274, and the highest at \$2,379. The market observed a liquidation of \$27.23 million worth of ETH during this timeframe, as per CoinGlass. Meanwhile, the daily trading volume of ETH has increased by 19.10% to \$15 billion, according to CoinMarketCap data. On the other hand, it is important to note that Ethereum has reached a four-month high in network growth, with 126,210 new wallets created last Sunday. Despite this, the market sentiment of ETH continues to reflect fear as the fear and greed index stays at 37. Investors and traders are concerned that the ongoing bearish phase could be prolonged if Ethereum (ETH) fails to rebound. Will ETH's Downside Pressure Continue? On the monthly chart, Ethereum's price has formed a series of lows, and the price has plunged 12.60%. An upside price correction was expected amid the volatility. However, in the past week, the asset has continued to slide down, noting a 6% drop. ETH fumbled from \$2.5K to \$2.1K. The current bearish pace could trigger ETH to collapse to the \$2.2K level. If the momentum persists, further pullback can be expected below the \$2K level. On the other hand, a rebound above the current price could bring a retest, and ETH might jump toward \$2,424. At the time of analysis, the daily Relative Strength Index (RSI) is positioned at 53.18, in the neutral zone. The RSI momentum and the short-term 50 and long-term 200 moving averages noted at \$2,368 and \$2,553 respectively, suggest that the current price momentum for ETH is bearish. Highlighted Crypto News

- Hong-Kong based Metalpha deposited 10K Ethereum to Binance in the past few hours. - Ethereum has recorded a 2.68% increase in daily price as per CMC data. The crypto sector during pivotal market situations sees increased whale activity. Whale movements when significant often influence cryptocurrency prices. Relatedly, in the last few hours, Hong Kong Asset management firm, Metalpha garnered market attention with significant Ethereum movements. Notably, LookOnchain reported that Metalpha moved 10,000 Ethereum tokens worth \$23.45 million in the early Asian hours. The deposit was made to a wallet connected to the Binance deposit with the address "0x667a". Additionally, the asset management firm has been depositing ETH to Binance for the past 4 days. Metalpha has transferred a total of 33,589 Ethereum worth \$77.59 million to the crypto exchange. Previously, on September 9, the firm had deposited another 10K ETH to Binance as per Arkham Intelligence data. Metalpha's current ETH holdings are 643.8 tokens worth \$1.51 million. Furthermore, in the past hour, Metalpha received 5.154K ETH from Binance Hot Wallet with the address, "0x497a". The asset management firm's ETH movements have raised market speculations as the reason has not yet been determined. Meanwhile, other Ethereum whales have also shown activity. One particular whale, "0x238a", transferred 14,588 ETH worth \$34.2 million to Coinbase as per WhaleAlert reports. Is Ethereum Showing Price Recovery Signals? In the past day, Ethereum price has begun to show upward movements after its decline over the week. The altcoin recorded a 2.68% daily price increase and returned to the \$2.34K levels. Ethereum began sparking bullish candles after sliding to an intraday low of \$2,274. At the time of writing, the token was trading at \$2,346 according to CMC data. Zooming out, the token's price shows a 6.98% decline in the last seven days. At the beginning of the week, Ethereum traded at a high of \$2,523 after which bears took over. However, if the altcoin manages to sustain the recent positive momentum, a price recovery can be expected. Furthermore, in the past two days, apart from Metalpha's Binance deposits, Ethereum co-founder Vitalik Buterin showed ETH movements. These movements caused speculations in the market, as the wallets that Buterin sent the tokens went on a selling spree. Highlighted Crypto News Today: FBI Reports Record \$5.6B in Losses from Crypto Scams in 2023

- Ethereum (ETH) has fallen to the \$2,200 range, a level not seen since late January. - Vitalik Buterin recently sold ETH worth \$1.835 million, and the Ethereum Foundation allocated 3,000 ETH for liquidity. Ethereum (ETH) has slipped into a challenging phase, with its price falling to the \$2.2K zone for the first time since late January. This decline comes amid several key developments and market shifts that are adding pressure to cryptocurrency. In recent weeks, Ethereum has struggled to maintain its upward momentum. The launch of a new decentralized exchange, Ethervista, and Ripple's move to integrate Ethereum smartcontracts into the XRP Ledger have added to the market's uncertainty. Furthermore, Vitalik Buterin's recent activity has sparked debate; his wallet has offloaded ETH worth \$1.835 million, and the Ethereum Foundation has committed 3,000 ETH to Kelp for

liquidity purposes. This selling activity has added to the market's concerns about ETH's short-term prospects. 24-H Price Movements and Market Sentiment for Ethereum Despite the recent drop, Ethereum's price has shown some signs of recovery, briefly rising to \$2,305. However, experts suggest that it may take some time for bullish sentiment to return. Over the past week, ETH has fallen by over 8.43%, though it did see a modest increase of 0.80% in intraday trading. At one point, the price hit \$2,337 before settling at \$2,306. Daily trading volume has surged to \$13.06 billion, reflecting heightened market activity. However, Ethereum's current market sentiment remains cautious, with the fear and greed index at 31, indicating prevalent fear among investors. After a brief dip to \$2,243 seen as a strong support level the cryptocurrency is making a modest rebound but faces resistance near \$2,350. ETH must overcome this resistance to achieve a more substantial recovery. Immediate support and resistance levels are at \$2,150 and \$2,400, respectively. In the 4-hour ETH/USDT trading chart, the MACD indicator shows mixed signals, leaning slightly bearish as the MACD line is below the signal line. Additionally, the daily RSI is at 47.50, suggesting ETH is nearing oversold conditions. Moreover, short-term and long-term moving averages remain above the current price, with the 50-day average at \$2,380 and the 200-day average at \$2,554. The Chaikin Money Flow (CMF) is at -0.01, indicating a decline in money flow and trading volume.

Bitcoin (BTC) and Ethereum (ETH) are two cryptocurrencies known for affecting the trajectory of the digital market. As such, a leading analyst in the metaverse has made bold predictions for these cryptocurrencies and their prices. According to this analyst, a surge in the prices of Bitcoin (BTC) and Ethereum to \$100,000 and \$6,000, respectively, will push ETFSwap (ETFS) to \$50. This article contains reasons for this analyst's prediction. An Unbelievable Upswing To \$50 Promises ETFSwap (ETFS) Investors 500,000% Gains ETFSwap (ETFS) has grown increasingly popular since its launch in Q1. This impressive cryptocurrency has continued to exhibit bullish traits while possessing industry-transforming features. ETFSwap (ETFS) is a futuristic platform that allows digital and traditional finance to coexist. With ETFSwap (ETFS), investors can conveniently trade tokenized ETFs for regular crypto tokens. Exchange-traded funds (ETFs) are DeFi innovations that continue to propel the cryptocurrency market. Each tokenized ETF offered by the ETFSwap (ETFS) platform receives funding from real-world assets. The platform's relationship with MiCa-compliant banks reassures investors of its standing. Also, ETFSwap (ETFS) offers investors a range of benefits. Some positives of owning an ETFS token include optimal market liquidity, 10X leverage on perpetual trading, and even governing rights. Experts believe this project will experience exponential growth as ETFs grow in adoption. Safety is a core value for the ETFSwap (ETFS) network. Asset security is a priority for the platform as it has undergone a comprehensive smart contract audit from CyberScope. In a bid to promote transparency, the platform's team was fully doxxed in a KYC verification audit by SolidProof. Both measures cement ETFSwap (ETFS) as a scam-free project free from hackers and bugs. Today, the ETFS token is available on presale for just \$0.03846. According to a top analyst, now is the best time to buy this cryptocurrency as experts make bold projections. As the market foresees a 500,000% surge to \$50, experts encourage investors to join this community for trans-generational wealth. Bitcoin's (BTC) Potential Surge To \$100,000 Leaves Investors Hopeful Bitcoin (BTC) is the first and most successful cryptocurrency in the financial market. As such, this coin can affect the industry's trajectory with its performance. When Bitcoin (BTC) falls in price, other cryptocurrencies follow suit, and when it rises, the market enters a bull run. Although Bitcoin (BTC) currently trades below \$60,000, this cryptocurrency peaked at an all-time high of \$73,738 in March 2024. Despite the market's violent swings, some analysts believe that a 100% upshoot from Bitcoin (BTC) will cause a ripple across the metaverse. If this cryptocurrency crosses \$100,000, millions of investors and thousands of cryptocurrencies will record sensational profits. Ethereum (ETH) Braces Up For A \$6,000 Trading Value Ethereum (ETH) has grown significantly over the years and has found its footing in various ecosystems within the market. One of these ecosystems is the NFT marketplace. Its lucrative features and fast-paced growth have made it more valuable in the digital world. Also, Ethereum has created a soft landing for various virgin cryptocurrencies like ETFSwap (ETFS). Therefore, a boost in Ethereum's price would naturally yield a shift for ETFSwap (ETFS). While the market waits earnestly for the manifestation of this forest, Ethereum (ETH) whales vouch for ETFSwap (ETFS) and its impeccable utility. Keynote Thoughts On The Future Of Bitcoin (BTC) And Ethereum (ETH) And Their Effect On ETFSwap (ETFS) Undoubtedly, Bitcoin (BTC) and Ethereum (ETH) are two of the most influential cryptocurrencies in the market. Both cryptos have triggered unparalleled innovation in the crypto verse since their inception. This is why a potential price shift for both cryptos will push ETFSwap (ETFS) into remarkable heights. However, this analyst has nudged investors to buy ETFSwap (ETFS) today as a 500,000% ROI is too great a gain to miss out on. - WisdomTree's withdrawal highlights regulatory hurdles in crypto ETF approvals. - The move may reshape investor expectations for Ethereum-based investment products. WisdomTree, a prominent asset management firm, has withdrawn its S-1 registration filing for the WisdomTree Ethereum Trust. The firm declared in a filing with the US Securities and Exchange Commission. The S-1 filing was intended to pave the way for WisdomTree's Ethereum Trust to be listed on the stock exchange. Allowing investors to gain exposure to Ethereum (ETH) through a regulated investment vehicle. This marks a significant development in the ongoing saga of cryptocurrency exchange-traded funds (ETFs). The U.S. Securities and Exchange Commission (SEC) has been scrutinizing cryptocurrency products more rigorously, which could have played a role in WisdomTree's decision. Additionally, fluctuations in Ethereum's price and broader market volatility might have contributed to the decision to delay. Following this, the withdrawal of the Ethereum Trust filing raises questions about the future of spot Ethereum ETFs and

the broader landscape of cryptocurrency investment vehicles. While Bitcoin ETFs have recently gained approval from the U.S. Securities and Exchange Commission (SEC), Ethereum-based products face additional scrutiny and challenges. The move by WisdomTree could influence other asset managers to consider similar products and potentially impact the timeline for Ethereum ETF approvals. Despite this setback, the cryptocurrency market continues to evolve rapidly. The withdrawal does not necessarily indicate a lack of interest in Ethereum or other digital assets but rather highlights the complex regulatory landscape. That firms must navigate when introducing innovative financial products.

Regulatory Implications in Crypto Market While the SEC has shown openness to Bitcoin ETFs, Ethereum, and other altcoins may face a longer path to approval. The situation highlights the need for clear regulatory frameworks to adapt to the rapidly evolving digital assets and blockchain technology world. Furthermore, the withdrawal of WisdomTree's S-1 registration filing underscores the significant regulatory and market challenges cryptocurrency investment products face. As the SEC continues to scrutinize digital assets, firms like WisdomTree must navigate a complex regulatory environment. This move highlights the broader difficulties in launching cryptocurrency-based financial products and may influence other firms' strategies in the evolving landscape of digital asset investments.

Highlight Crypto News Today: VanEck to Liquidate and Close Ethereum Futures ETF Amid Low Interest

- The Ethereum Foundation treasury currently holds \$650 million in the main wallet. - Ethereum has plunged by 5%, trading at \$2,260. The non-profit organization of the Ethereum blockchain, Ethereum Foundation, will release an updated financial report, as per the official statement. The organization's treasury has witnessed a significant reduction, with its main wallet holding approximately \$650 million. This represents a steady decline in the foundation's holdings since March 2022. At that point, the Ethereum Foundation treasury reported a balance of about \$1.6 billion. Moreover, the Ethereum (ETH) price was notably higher, and the foundation held approximately \$1.3 billion in ETH and about \$11 million of another crypto. This underscores the market volatility that has impacted the foundation's holdings. The prominent researcher at the Foundation, Justin Drake, confirmed that he is the Reddit user "bobthesponge1," who participated in a typed ask-me-anything on an Ethereum subreddit. Also provided the information on the organization's finances. The foundation spends around \$100 million per year and currently has roughly a 10-year runway, depending on the price of ether (ETH), the blockchain's native token. Drake wrote in the AMA session that "The EF has a fiat buffer to cover a couple of years of runway." Ethereum co-founder Vitalik Buterin mentioned that the current budget strategy is to spend 15% of the remaining money every year. On the other hand, as per on-chain data, the Ethereum Foundation has transferred 35,000 ETH, approximately worth \$94.07 million, to the Kraken exchange. Meanwhile, over the last two years, funds have notably declined due to the burn rate and price decreases.

Price Momentum of Ethereum Over the past week, ETH faced a critical drop of over 10.40%, falling back from \$2,525 to \$2,330. At press time, the asset witnessed a decline of 5%, trading at \$2,260. Meanwhile, the daily trading volume has increased by 94.33%, to \$26.12 billion, as per CMC data. The token visited its 24-hour low and high price at \$2,150 and \$2,405, respectively. Moreover, the market sentiment of ETH stays in the fear zone, as the fear and greed index stays at 27.

Highlighted Crypto News VanEck to Liquidate and Close Ethereum Futures ETF Amid Low Interest

The crypto market remains volatile as the two leading giants, Bitcoin (BTC) and Ethereum (ETH), struggle to gain traction. Bitcoin (BTC) has fallen sharply below crucial resistance, extending its bearish trend into September, while Ethereum has stayed below its All-Time High (ATH). On the other hand, ETFSwap (ETFS), a new ETF-trading token, is creating a buzz in the presale market, with predictions of a remarkable 100X surge.

ETFSwap (ETFS): The Best Haven For Investors Seeking Profit Maximization ETFSwap (ETFS) is a rising DeFi platform poised to revolutionize the crypto market through its innovative approach to ETF-trading. Using blockchain technology, ETFSwap (ETFS) has created an environment where investors can swap their crypto assets for tokenized ETFs. The ETFs can be traded seamlessly on ETFSwap's decentralized trading system which is equipped with some of the best trading features and tools. At the center of the ETFSwap ecosystem is its native token, ETFS which offers various benefits for those who hold them. This includes low trading fees, the ability to vote on the platform's governance, and a staking mechanism where traders can earn up to 87% APR yield. Investors who trade ETFs on ETFSwap (ETFS) will also be granted access to high leverages of up to 50X on perpetual and option trades across listed ETFs. ETFSwap's AI-powered tools, like the ETF tracker and screener further provide high value trading recommendations and updates on ETF listings for traders. As a decentralized platform, ETFSwap (ETFS) is equipped with highly advanced security protocols which have been thoroughly audited by CyberScope, a leading blockchain audit firm. The ETFSwap team has also completed an additional KYC verification procedure conducted by SolidProof, ensuring that users are guaranteed a highly secure and transparent trading environment. ETFSwap's innovative trading features and successful ongoing presale have contributed to more large-scale investors investing in the ETFS token, and viewing the futuristic cryptocurrency as the next best investment opportunity in the space. Should Bitcoin (BTC) and Ethereum regain momentum, ETFSwap (ETFS) will indeed surpass its 100X prediction by multiple analysts.

Bitcoin (BTC) To Test Key Resistance Since its halving event on April 20, 2024, Bitcoin (BTC) has continued to trade sideways, recording severe price declines. This fact has deterred analysts' expectations of Bitcoin's price this month, with analysts predicting a price bottom between \$50,000 to \$40,000 for the cryptocurrency. Captain Faibik, a Bitcoin (BTC) expert, has forecasted a potential price retest to \$54,000 for the cryptocurrency this month. While investors predict how Bitcoin's price could progress this month, the cryptocurrency has raised hope following its slight rise in momentum recently. Despite the persistent bearish phase, Bitcoin (BTC) is still on track for a potential bull run this cycle. Captain Faibik foresees a significant rise to \$68,000 this September for the pioneer cryptocurrency. As of writing, the price of Bitcoin (BTC) is trading at \$58,987, reflecting a 1.04% increase in the last 24 hours, according to CoinMarketCap.

Ethereum (ETH) Faces Prolonged Price Decline Although Ethereum is

expected to rally alongside Bitcoin (BTC) this year, the altcoin has been experiencing substantial and unexpected declines in its price. Earlier in March, Ethereum struggled to reach \$4,000, constantly fluctuating below the \$3,000 mark. As the Third-Quarter (Q3) of 2024 concludes, historical trends suggest that Ethereum may continue to witness price declines. According to data from Coinglass, these recent months have historically been the worst for Ethereum's price since 2016. However, with the growth and increasing demand for Ethereum Spot ETFs, the price of Ethereum could potentially move out of bearish trends. However, for now, Ethereum's price still reads bearish, trading at a price of \$2,540, according to CoinGecko. Conclusion Amidst the bearish trends in top cryptocurrencies like Ethereum and Bitcoin (BTC), investors are seeking new promising opportunities in leading presale projects like ETFSwap (ETFS). With a vast revenue of over \$3.54 million already accumulated and a high-profit potential, now is the ideal time for investors to participate in the ETFS token presale. By investing at the current price of \$0.01831, investors can position themselves ahead of the anticipated price increase to \$0.03846 in its next presale stage. For more information about the ETFS Presale: Disclaimer: TheNewsCrypto does not endorse any content on this page. The content depicted in this press release does not represent any investment advice. TheNewsCrypto recommend our readers to make decisions based on their own research. TheNewsCrypto is not accountable for any damage or loss related to content, products, or services stated in this press release.

- Shareholders will be able to sell their EFUT shares until September 16, 2024. - The ETF will be delisted and trading will cease after this date. Ethereum ETF Futures (EFUT) will be discontinued and liquidated by the prominent investment management company VanEck. The price of ETH, which was already experiencing a period of erratic trading due to a general market decline, has taken a huge hit. Among the many factors given by the ETF provider for the decision are declining market interest and performance issues. Recent news indicates that VanEck's Ethereum Futures ETF, traded on the CBOE, would be liquidated and closed. The decision was made after a thorough evaluation of the company's products and services. With an emphasis on liquidity, performance, and investor demand as a whole. The ETF issuer has decided to wind down the fund since, in their opinion, the EFUT has not lived up to their expectations. Dwindling Interest and Trade Activity At the same time, the company has informed shareholders that they will be able to sell their EFUT shares on the CBOE market until September 16, 2024. The ETF will be delisted and trading will cease after this date. Nevertheless, beyond this date, on September 23, 2024, every shareholder who still owns shares will get a payout from the liquidation based on their net asset value. Furthermore, the decision underscores larger worries about the market attitude towards Ethereum futures. Particularly in light of dwindling interest and trade activity. The company noted that the Ether ETF's performance has been affected by low investor demand and continued market issues. But after getting its US Spot Ethereum ETF approved, VanEck is also trying to streamline its strategic portfolio, which is why it made its latest choice. This action is in line with the firm's previous decision to phase down its Bitcoin Futures ETF. After its US Spot Bitcoin ETF was approved in January, indicating a clear intention to focus on spot market products. Highlighted Crypto News Today:

- Ethereum holders have moved 312,183 ETH (worth \$751M) to exchanges recently. - Increased exchange deposits reflect growing investor uncertainty. In the past week, Ethereum holders have experienced significant selling pressure. A total of 312,183 ETH, valued at approximately \$751 million, has been deposited into exchanges. This surge in exchange deposits reflects growing uncertainty among investors. Market watchers are closely monitoring these developments as they signal a potential shift in sentiment. Recent trends indicate that Ethereum's market performance has been under scrutiny. Over the past week, Ethereum has faced fluctuations in value. Last week, ETH saw a decrease of 4.5% in its trading value, according to CoinMarketCap. This decline comes amid broader market volatility and increased selling activity. Can Ethereum Break the Key Resistance? Support levels for Ethereum are crucial to watch. Currently, support stands at \$1,580, where the price has historically bounced off. Additionally, \$1,500 is another key support level. A drop below this point could signal further bearish movement. Resistance levels are also important. Ethereum faces resistance at \$1,800, a point where sellers have historically outweighed buyers. Overcoming this level would be significant for a bullish trend. Another resistance level is \$1,900, which Ethereum must surpass to signal stronger buying interest. The Relative Strength Index (RSI) is currently at 40, suggesting that ETH is approaching oversold territory. These indicators reinforce the notion of a cautious outlook for ETH in the short term. Moreover, recent news highlights that traders are offloading their holdings, contributing to the increase in exchange reserves. This behavior often points to investor concerns about potential future declines or market instability. As such, Ethereum's price movements in the coming days will be crucial in determining the direction of this trend. This trend, combined with technical indicators showing bearish signals, suggests a period of uncertainty for the cryptocurrency. Investors and analysts will need to keep a close watch on market developments to gauge whether this trend will continue or reverse. Highlighted Crypto News Today Ethereum Co-founder Vitalik Buterin Redirects Focus Away from L2 Tokens

- Vitalik Buterin will donate all his L2 tokens to support Ethereum public goods and charities. - The market saturation of L2 solutions may need consolidation for sustainable growth. Vitalik Buterin's decision to donate his L2 tokens instead of investing further highlights a critical market trend. Layer 2 solutions, such as Optimism and Arbitrum, have gained popularity. They offer much-needed scalability for Ethereum by processing transactions off-chain. However, Buterin's recent announcement suggests he believes the market is overly focused on the speculative value of these tokens. BTW the above also applies to L2 tokens or other project tokens I hold (incl not-yet-liquid): all proceeds will be donated, again either to support public goods within the ethereum ecosystem or broader charity (eg. biomedical R&D). "vitalik.eth (@VitalikButerin) September 5, 2024 I also do not intend to invest into L2s or L2 tokens have experienced significant price fluctuations. This

has attracted considerable investment interest, especially as Ethereum continues to face high gas fees and network congestion. While projects like zkSync have introduced native tokens to incentivize users, market speculation often overshadows real technological advancements. By choosing to donate rather than invest, Buterin is encouraging a shift in focus. Evaluating the Saturation of L2 Tokens The market is currently saturated with various L2 solutions. Each project offers a different approach to scaling Ethereum. This proliferation makes it difficult to distinguish between genuinely innovative projects and those merely riding the hype. Buterin's decision to step back from investing could reflect this saturation. He might be signaling that the market needs to consolidate. This would allow for a more mature and responsible development. Buterin's focus on supporting public goods within the Ethereum ecosystem is also telling. Public goods, such as open-source development, often struggle to secure funding. This is especially true in a market dominated by profit-driven ventures. By donating his L2 tokens, Buterin channels resources into areas crucial for Ethereum's long-term success. These areas may not offer immediate financial returns, but they are essential for the network's sustainability. Buterin's decision reflects a strategic shift towards sustainability. This approach serves as a reminder to the market to prioritize the long-term potential of Layer 2 solutions. This focus could lead to more balanced growth for L2 tokens and the Ethereum network as a whole. Highlighted Crypto News Today Binance CEO Richard Teng Confirms CZ Ban from Binance

The debate over the top DEX on Ethereum is intensifying as established leaders Aave (AAVE) and Uniswap (UNI) encounter issues while a new entrant called RCO Finance is already disrupting the market. With innovative features and a lucrative public presale, RCO Finance aims to capture market share and establish itself as the leading Ethereum DEX. Let's explore how RCO Finance might surpass Aave (AAVE) and Uniswap (UNI). RCO Finance: Making Trading Accessible to All While Aave (AAVE) and Uniswap (UNI) have garnered significant attention as established Ethereum DEXs in the crypto space, RCO Finance (RCOF) is rapidly emerging as a strong contender, thanks to its remarkable features. Although relatively new, RCO Finance is gaining traction by seamlessly integrating artificial intelligence with blockchain technology to revolutionize cryptocurrency trading. The recent launch of its flagship product, Robo-Advisor, marks a significant breakthrough. This advanced trading tool provides users with personalized financial recommendations, economic data analysis, and insights into market trends. Unlike traditional human advisors, the Robo-Advisor can process vast amounts of data and deliver highly accurate advice in real-time. Moreover, RCO Finance (RCOF) distinguishes itself from established platforms by promoting accessibility. The Robo-Advisor is integrated into a user-friendly DeFi trading platform, ensuring that even novice traders can easily navigate the system and leverage sophisticated trading strategies that were once exclusive to experienced investors. Building on the success of its innovative Robo-Advisor, RCO Finance has further strengthened user trust and confidence by undergoing a comprehensive smart contract audit conducted by the reputable security firm SolidProof. This audit reinforces the reliability and transparency of its underlying infrastructure. Uniswap Faces Mixed Reactions Ahead of V4 Launch Uniswap Labs, the main developer of a popular decentralized exchange on Ethereum, is launching a \$2.35 million security competition. This project aims to ensure the upcoming version 4 (V4) is safe and reliable. V4 will bring important upgrades, including a new Universal Router system that lets users swap NFTs and ERC-20 tokens. The crypto community is excited and worried about the V4 update. Many people hope for improved security and features, but others are concerned about the new licensing model. The news did little to impact UNI token prices last week, with the token declining nearly 3% amid broader market volatility. Bearish Trend Continues For AAVE Price Despite ZKSync Integration ZKSync, a Layer 2 solution for Ethereum, recently announced plans to launch Aave V3 on its first zero-knowledge (ZK) blockchain, Era. Integrating Aave V3 is anticipated to enhance decentralized finance (DeFi) functionalities on Era, paving the way for fresh opportunities for institutional players. During the final testing phase, ZKSync encountered a technical glitch, prompting a temporary halt in the launch of Aave V3. Although they subsequently confirmed that the issue had been rectified, the price of AAVE remained bearish, hovering around \$134, marking a notable 8.8% decline over the past 12 days. RCOF: The Most Sought-After DEX Token of 2024 Other DEXes have yet to beat the opportunities presented by RCO Finance, especially in its ongoing presale. With over \$1.7 million already garnered in the presale, the RCOF token has become the most sought-after DEX token this year. Currently priced at \$0.0344 in Stage 2, RCOF is set to advance to Stage 3 with a new price of \$0.0559. However, analysts are projecting that RCOF could reach between \$0.4 and \$0.6 upon listing, signifying a growth potential of up to 1600%. This outlook has drawn comparisons to the 2021 bull runs of Uniswap and Aave, with some speculating that RCOF might even surpass them. But there's more to it. Presale investors also stand to benefit from 30% of RCOF's revenue. With estimated daily revenues of around \$500,000 in the first year and \$750,000 in the second year, it's no wonder that numerous prominent crypto influencers are endorsing this DeFi platform. For more information about the RCO Finance (RCOF) Presale: Disclaimer: TheNewsCrypto does not endorse any content on this page. The content depicted in this press release does not represent any investment advice. TheNewsCrypto recommends our readers to make decisions based on their own research. TheNewsCrypto is not accountable for any damage or loss related to content, products, or services stated in this press release.

- Almost two years have passed since Ethereum's upgrade, The Merge. - The current price of ETH/BTC is 0.0425, the lowest level since April 2021. Analysts claim that since the "merge" to proof-of-stake on the Ethereum blockchain occurred about two years ago, Ethereum's performance has lagged behind Bitcoin's by a margin of up to 44%. Almost two years have passed since Ethereum's upgrade, The Merge, which transitioned to a proof-of-stake network, and next week will observe that anniversary. Analysts from CryptoQuant found that Ethereum has lagged behind Bitcoin by 44% since then. Despite the approval of Ethereum spot exchange-traded funds (ETFs) in the US on July 23, the experts noted that ether has still lagged behind Bitcoin. The current price of ETH/BTC is 0.0425, the lowest level since April 2021. Further Decline on the Cards According to analysts at CryptoQuant, ether's
