

these repayments are part of the long term triumph or the scandalous collapse, which caused many traders to lose a lot of money. Due to the infamous activities of its former CEO, Sam Bankman-Fried. In light of this development, the exchange reworked its restructuring plan. And extended an opportunity for complete repayments to the impacted traders within the specified timeframe. On October 22, November 20, or December 12, 2024, one of the three “omnibus hearings” will take place, after which the much anticipated payouts will be made. The total payout procedure for all claimants should be facilitated by the hearings. Disbursements to victims may begin before the year ends if the District of Delaware approves the Chapter 11 plan before October 7. Regrettably, compensation is no longer available to anybody who failed to file claims by September 29, 2023. Many in the crypto community are hoping that this impending infusion of capital will trigger the greatest bull run in the industry’s history, and the anticipation is palpable. This is a once-in-a-lifetime opportunity for crypto investors. Since a significant portion of the \$16 billion in FTX repayments is anticipated to reenter the market. Highlighted Crypto News Today: Ripple Prepares for RLUSD Launch with Major XRP Ledger Upgrades - Mango DAO and partners settled with the SEC over unregistered MNGO token sales. - The entities agreed to pay \$700,000 in penalties to the SEC. The U.S. Securities and Exchange Commission (SEC) declared a settlement with Solana-based DeFi platform Mango DAO and Blockworks Foundation for selling unregistered crypto assets known as “MNGO” tokens. This settlement also involved Mango Labs, which was accused of engaging in unregistered broker activities related to the sale of various cryptocurrencies on the Mango Markets platform. The SEC’s complaint highlighted that these entities bypassed the federal registration requirements, denying investors the essential protections mandated by law. Settlement Details and Allegations Against Mango DAO As part of the agreement, Mango DAO, Blockworks Foundation, and Mango Labs have collectively agreed to pay a civil penalty of \$700,000. Additionally, they have also committed to demolishing their tokens and requesting their removal from exchanges, and stopping any future promotion of these tokens. Notably, the settlement was reached without any admitting or denial of the allegations, and it remains subject to court approval. Further, the SEC’s complaint stated that Mango DAO, registered as a decentralized autonomous organization, along with the Panamanian entity Blockworks Foundation, raised over \$70 million through unregistered offerings of MNGO tokens starting in August 2021. This token is a governance asset for the Mango Markets platform, and it sold to numerous investors worldwide, including US. The complaint also stated that Blockworks Foundation and Mango Labs operated as unregistered brokers. They promoted Mango Markets and assisted users in trading securities. In August 2024, the Mango DAO community voted to settle with the SEC and destroy MNGO tokens. Later, in September, Mango Markets offered \$500,000 to settle a separate investigation by the Commodity Futures Trading Commission (CFTC). Highlighted Crypto News Today

As for the current climate in the digital currency economy, an indication of a market reversal for Ripple (XRP) and Cardano (ADA) might be noted in 2024 when both tokens appear in price. But it does not help them move forward and appreciate all new updates, new technology, and even better prospects; there is still a run from looking at new projects, like Rexas Finance (RXS), which is now priced under ten cents. This article collects some current performances for XRP and ADA and compares them with the case of Rexas Finance, which is bringing investors focus with its ease in real-world asset tokenization. XRP and its increasing adoption of digital payments As so many people keep on saying about Ripple’s XRP, it’s not a new finding that it has disruptive capabilities, particularly in the area of cross-border payments. Thanks to the use of XRP Ledger, transactions become simpler and cheaper as they do not require clearing houses. Therefore, this makes it possible to send money abroad to everyone, as simple as it sounds. Ripple, however, has taken steps to enhance its image as a bridge currency for international payments through forming partnerships with the banks. Made in such a way that decentralizes and improves the efficiency of the crypto market. XRP remains a strong player within the crypto market. Ripple’s escrow synthesis, which retains a large percentage of XRP tokens, enhances the stabilization of supply and market saturation. Understanding this restrained approach to the emission of tokens helps to appreciate the reasons behind the steady growth and prevention of sharp price declines. There have been raised levels of XRP in recent weeks, and the surveyed professionals believe that the coins will appreciate further, although most of the experts in the market remained cautious. In particular, even though most technical indicators support the position that the price of XRP is likely to increase within the next few weeks by more than 20%, it is worth noting that the token has been largely stable. It portrays a scenario whereby, at least, the bullish sentiment has not reached fanatic proportions. Ripple expects growth in the future but has a good chance of getting monopolized by new operational projects. Cardano’s Scalable and Energy-Efficient Blockchain Cardano (ADA) is yet another platform getting vaulted into the limelight over the adoption of sustainable and scalable practices. Cardano is an even better alternative as it relies on proof-of-stake PoS upon the Ouroboros scheme rather than the energy-demanding proof-of-work cryptocurrencies. The two-layer structure of ADA, where one is to settle the transactions and the other is for the computations, improves scalability further where the system is capable of handling one million transactions per second. Cardano’s extension to support native tokens in the year 2021 has increased the use cases of the network, attracting more developers to create decentralized applications and smart contracts. There has been growth in the platform owing to its ability to handle intricate decentralized finance (DeFi) applications at low-cost fees and with high-security measures. Just how bright the future of Cardano is raises the expectations of the price eating over 16% more in the short run while the market is still dealing with unquestionable rivals. The rising focus on the green technology and smart contract features of Cardano has not been enough to boost its price increase to the levels observed in past years. Currently, Cardano is a high player in the growing environment; however, similar to XRP, on the other hand, it has encountered common challenges in growth due to the entry of new competitors. Rexas Finance: Pioneers in Real-World Assets Tokenization Even as XRP and ADA are churning out innovations, Rexas Finance (RXS) is showing how fierce a competitor can be, especially with its presale drawing valid interest from investors. At rates lower than \$0.10, the fundamentals of Rexas Finance extend far beyond the payment or smart contract utility a cryptocurrency offers. Rather, Rexas Finance looks to the real estate market and takes it a step further by allowing investors to manage physical assets through tokenization by being provided with real estate, art, and bonds fractionalized shares. Such a strategy fills an important niche in the ecosystem by creating liquidity and the ability to invest in relatively conservative asset classes that are usually beyond the reach of a regular investor. The platform of Rexas Finance seeks to make it easier to tokenize the real-time asset to an application that is secure and transparent. There is a lot of investment in the platform’s incentive for high returns due to early-stage presale prices. Rexas Finance is unique because it bridges the gap between blockchain technology and the actual financial market. Analysts project this can bring 10x to early investors, making it one of the most hyped tokens of 2024. Assuming XRP and ADA are growing steadily, Rexas Finance’s disruptive strategy and low cost of entry may provide the advantage necessary to move ahead of XRP and ADA in the future. Conclusion XRP and ADA have every right to be the most popular terms on the cryptocurrency market, as both supply a distinct technological solution that has established them as a leading representation in the cryptocurrency market. The primary target for XRP is cross-border money transfers while Cardano is cherished by investment and technology lovers alike because it incorporates environmental factors. Nevertheless, both are becoming an uphill task. Rexas Finance, the new token in town, is also in the race and gaining more market space due to the fact it is concentrating on the tokenization of real-world assets. Rexas Finance presents itself as a highly lucrative investment option, especially considering its current market price, even in a sector that has been otherwise dominated by the big boys. Rexas Finance has come out as an investment opportunity in the crypto space in the next big thing as it redefines blockchain technology. For more information about Rexas Finance (RXS) visit the links below: - Website: <https://rexas.com> - Win \$1 Million Giveaway: <https://bit.ly/Rexas1M> - Whitepaper: <https://rexas.com/rexas-whitepaper.pdf> - Twitter/X: <https://x.com/rexasfinance> - Telegram: <https://t.me/rexasfinance> Disclaimer: TheNewsCrypto does not endorse any content on this page. - This integration comes especially close to the debut of dYdX Unlimited, the biggest protocol upgrade to date. - Over 7 million more people may now access dYdX’s ecosystem thanks to the integration. The dYdX Foundation is excited to announce that dYdX Chain and the popular Phantom Wallet have been integrated, greatly increasing the number of people who may access the decentralized finance protocol. With this new integration, Phantom’s large user base now has an easier method to engage with dYdX. Key Integration Highlights: - Expanded Wallet Support: Phantom is the latest addition to dYdX’s list of supported non-custodial wallets, which already includes Keplr, Coinbase Wallet, OKX Wallet, and MetaMask. - Seamless User Experience: Now, users may easily deposit USDC and link their Phantom wallets to start trading on dYdX’s decentralized order book. - Significant User Base Expansion: Over 7 million more people may now access dYdX’s ecosystem thanks to the integration with Phantom Wallet. Charles “Haussy, CEO of the dYdX Foundation, commented on the integration: “Following the integration of Solana’s Raydium markets into dYdX, integrating the leading Solana wallet, Phantom, was a logical next step. This provides Phantom’s 7 million users with direct access to dYdX’s professional trading DeFi protocol. Phantom’s reputation for intuitive design and streamlined web3 onboarding is consistent with dYdX’s dedication to accessibility in decentralized finance. This integration comes especially close to the debut of dYdX Unlimited, which is expected to be the biggest protocol upgrade to date. Looking Ahead: dYdX Unlimited The capabilities of the protocol are anticipated to be revolutionized by the future dYdX Unlimited release: - Trade Anything: Introduction of various crypto-assets and prediction markets, as well as an almost infinite number of perpetual markets. - Unrivaled liquidity with MegaVault: By implementing a state-of-the-art liquidity pool to serve markets listed on dYdX, trading possibilities and capital efficiency are increased. - Permissioned Keys: By giving consumers more precise control over wallet access, permissioned keys greatly increase trader security on dYdX. In addition to improving trade now, Phantom’s integration with dYdX Chain paves the way for further advancements in decentralized finance in the future. The goal of the dYdX Foundation is to facilitate communities, developers, and decentralized governance in order to strengthen and expand the dYdX protocol ecosystem.

Even though the cryptocurrency market is very volatile, still, some analysts have gone to extremes to predict trends as well as movements. A certain Wall Street analyst with an impressive track record of calling the Fed’s 50bps cuts is now suggesting five of the most undervalued cryptocurrencies in the market. Such tokens are Rexas Finance (RXS), Cardano (ADA), Toncoin (TON), Tron (TRX), and Jupiter (JUP) line up for explosive growth in the near term. Rexas Finance (RXS): Leading The Introduction Of Real-World Asset Tokenization Rexas Finance aims to be a leader in “RWA” transactions, which is a new paradigm that allows interested buyers to purchase and trade portions of expensive assets such as real estate, jewelry, paintings, and other commodities. The project has been in the limelight for allowing investors to implement these assets with the click of a few buttons, making historically cash-trapped industries reachable by the masses. RXS is still in its presale stage and is being sold at a rate of \$0.05. As such, reporting has raised a little above \$1,400,000. There is a craze for this project, and experts also believe that the price could shoot up to as much as \$0.20 after the presale, with early investors looking at possibly 6x returns on their initial investment before the coin makes an entry on any major exchange platforms. Since real estate is already a \$280 trillion market, the disruptiveness of Rexas Finance towards the existing operational modalities of asset ownership has no match. As far as the project’s ecosystem is concerned, Rexas Token Builder enables anyone to sell or buy property in such a way as to tokenize the assets, hence widening the pool of investors. Rexas Finance is such an ecosystem that includes all of the tools to meet circumstances that the RWA tokenization revolution is expected to bring about, including the Rexas Launchpad, where funds for tokenized projects will be raised by the users. Cardano (ADA): An Immovable Rock on the Path of Sustainable Blockchain Technology Cardano has been investors’ choice in search of a safe, energy-efficient blockchain alternative for quite some time. Continuously pricing at about \$0.34, Cardano has come up strong with the proof-of-stake (PoS) network along with smart contract functionality. It is well known for its security, scalability, and sustainability, which has positioned it to be a long-term game within the blockchain industry. Given the upcoming improvements and partnerships, analysts believe that ADA could reach between \$3 to \$5 in the forthcoming bull run, translating to great returns for long-term holders. While Cardano may not possess the short-term exponential rise potential of Rexas Finance, its consistent growth in price makes it a worthwhile investment. Toncoin (TON): High-Speed Blockchain in Demand Currently selling for \$5.65, Toncoin (TON) is gaining traction within the marketplace due to its blockchain capacities. Toncoin, an offspring of Telegram Open Network (TON), has also been streamlined to enable the execution of a high number of transactions in a short time and on one network. This puts it ahead of very high-performance networks such as Ethereum and Solana. After almost a two-month pause, 17-year-old Toncoin has jumped in price by about fifteen percent. This is a clear indication of interest from investors. As more decentralized apps (dApps) are built on top of the TON infrastructure, it is estimated that the price of TON could rise to the range of \$50 to \$60 during the next market surge. Its effective network and increasing number of users allow for the rise of Toncoin as a quick and long-term investment. Tron (TRX): Expansion of a Decentralized Network for Developing Application Platforms Tron (TRX) has reported for so long, as one of the leading platforms for dApps and smart contracts. Even at \$0.15, Tron is developing its ecosystem further, and there are good prospects for DeFi and NFT adoption within the ecosystem. Its cheap transactional costs as well as the ability to support huge transaction volumes make it attractive to the developers and investors. In light of further development of new

Win-win projects and executable contracts. Experts predict that Tron will appreciate and sell at \$0.55 or higher by 2025, which would be 3x to 5x from its current valuation. Jupiter (JUP): Why Jupiter Foundational token (JUP)? Lastly, Jupiter, although relatively unknown, has the potential to disrupt markets by focusing on security and privacy in decentralized systems. Even if JUP is at \$0.8 right now, it is generating interest because of the possibilities the token holds in the sale of private information and communication in decentralized markets. In the coming years, due to the rising importance of privacy within the blockchain ecosystem, experts regard JUP as capable of yielding over 10x returns. Conclusion: A Portfolio for Explosive Growth Itâ€™s worth noting the Wall Street expertâ€™s picksâ€”Rexas Finance, Cardano, Toncoin, Tron, and Jupiter. Each of them can appeal either to high-risk, high-return investors or to those who prefer a more measured, long-term approach. Rexas Finance is the most likely to bring massive profits in the short term since it provides a unique way for the tokenization of real-world assets. On the other hand, Cardano and Toncoin can provide strong returns, but over a longer time frame. These five tokens belong to the active stage of market development and are poised to take off. Therefore, every investor who is thinking about the growth of the entire crypto market should stock these five tokens. For more information about Rexas Finance (RXS) visit the links below: - Website: <https://rexas.com> - Win \$1 Million Giveaway: <https://bit.ly/RexasIM> - Whitepaper: <https://rexas.com/rexas-whitepaper.pdf> - Twitter/X: <https://x.com/rexasfinance> - Telegram: <https://t.me/rexasfinance> Disclaimer: TheNewsCrypto does not endorse any content on this page. Solana and Bitcoin Cash are established powerhouses in the crypto market, known for their significant market caps and robust ecosystems. Following a Solana announcement about a new phone in its Seeker series, Solanaâ€™s prices saw a notable increase. Meanwhile, Bitcoin Cash (BCH) holders continue to enjoy steady gains, underscoring the coinâ€™s resilience in a volatile market. However, as the industry shifts towards growth, newer, high-potential projects are beginning to overshadow these veterans. BlockDAG, a layer 1 network with a cutting-edge ecosystem, stands out particularly. With its recent testnet launch and the introduction of the BDAG50 bonus codes, BlockDAG is capturing attention and accelerating presale inflows. Already raising over \$76.2 million, this network is on track to redefine expectations in the top crypto coins right now. Solana Announcement Boosts Market Interest Solana Mobile recently announced its latest crypto-focused smartphone, the Solana Seeker, set to hit the market in the second quarter of 2025. The Seeker is priced at \$500, with early pre-orders available at \$450. This Solana announcement followed the success of the earlier Saga phone, which launched at \$1,000 but later dropped to \$599. Solana Mobile has already secured over 140,000 pre-orders, despite having only produced 20,000 units so far. Seekerâ€™s upgraded specs include 128GB of storage, 8GB of RAM, and improved camerasâ€”32-megapixel and 108-megapixel sensors. Solana Mobile also partnered with Solflare to provide in-built custody solutions for crypto users. To encourage adoption, Seeker buyers will receive a free Genesis NFT and access to Heliumâ€™s 120-day wireless subscription. Bitcoin Cash (BCH) Holders See Steady Gains Bitcoin Cash (BCH) holders have seen their coin climb by 5.64% in the past week, with the price now trading at \$342.67. This follows the Federal Reserveâ€™s first interest rate cut in four years, which initially caused a dip in many altcoins. While some large investors feared the rate change would negatively impact the crypto market, Bitcoin Cash has shown resilience, managing to stay on an upward trend despite the broader market concerns. However, despite these gains, a portion of Bitcoin Cash (BCH) holders remains cautious about the coinâ€™s long-term growth. Many are exploring other investment opportunities, including newer projects like BlockDAG, which have the potential to deliver higher returns. As BCH continues to hold its ground, some investors are considering diversifying into more promising alternatives to recover losses or maximize future gains. BlockDAG Presale Hits Fresh Peaks Ahead of Big Rebrand BlockDAG is making significant strides with an upcoming brand refresh that promises exciting updates to its website and platform. To celebrate this milestone, the network has introduced a 50% bonus on all coin purchases. This special offer is available until October 14th, and users can take advantage by applying the code â€”BDAG50â€”during purchase. The bonus has generated a lot of enthusiasm, drawing in new investors and adding momentum to BlockDAGâ€™s growth. Adding to the excitement, BlockDAG announced that its Testnet and Blockchain Explorer went live on September 20th, 2024. This launch is a major achievement on their roadmap, bringing them closer to releasing the Mainnet. The Testnet offers the community a first-hand experience to explore and test the blockchainâ€™s capabilities, providing a glimpse into what the future holds for the platform. The Testnet introduces several key features. The Blockchain Explorer gives users comprehensive access to the BlockDAG Blockchain, allowing them to view detailed block information and track transactions. With the Blockchain Faucet, users can mint their own BDAG coins on the Testnet and transfer them using the MetaMask wallet. Additionally, the network supports MetaMask Wallet Connect, enabling seamless sending and receiving of BDAG coins. To showcase the blockchainâ€™s versatility, sample smart contracts are available for testing functions like minting NFTs, staking coins, and burning tokens. With these developments, BlockDAG is positioning itself among the top crypto coins right now. The combination of innovative technology, user-friendly features, and the generous BDAG50 bonus code makes it an attractive option for investors seeking new opportunities. As the October 14th deadline approaches, the momentum continues to build, making this an exciting time to be part of the BlockDAG community. Why BlockDAG is the One to Watch Solana and Bitcoin Cash (BCH) holders may have seen gains recently, but BlockDAG is quickly becoming one of the top crypto coins right now. With over \$76.2 million raised and a 120% return for early investors, the excitement around BlockDAGâ€™s upcoming rebrand is undeniable. To celebrate, the network has introduced the BDAG50 bonus code, offering a 50% bonus on all purchases until October 14th. This, along with its successful testnet launch, puts BlockDAG in a prime position for growth, making it a strong contender following the latest Solana announcement. Bangalore, India, September 26th, 2024, Chainwire The Huddle01 decentralized Real-Time Communications Network is a multi-sided network with Media Nodes, suppliers of dRTC bandwidth for participants and consumers of audio/video meetings. On November 6, 2024, Huddle01, a leading decentralized real-time communications layer, will launch its media node sale. Huddle01 is setting new standards in decentralized communication, offering a robust and efficient solution to the challenges faced by traditional real-time communication (RTC) providers. Since 2023, Huddle01 has hosted 6 million minutes for more than 100,000 events. The first dRTC Network Huddle01 is the first Decentralized Physical Infrastructure Network (DePIN) for RTC or audio/video conferencing. Huddle01 coordinates unused internet bandwidth through node operators to enable seamless audio-video communication via its innovative decentralized, or dRTC network. Unlike most DePINs, Huddle01 is built from the demand side, addressing the high operational costs and geographical latency issues faced by centralized RTC networks. Founded during Covid-19 as Indian schools moved online, Huddle01 replaced centralized communication systems, which route calls through distant servers â€”often halfway across the world â€”causing significant delays and poor performance for video conferencing. By reducing the reliance on centralized data centers, Huddle01 also minimizes developersâ€™ server costs for audio and video calls by up to 95% compared to AWS, ensuring cost-effective and high-performance communication. Huddle01â€™s app layer Huddle01 Meet integrates Web3-native tools, allowing users to connect wallets, use NFT profile pictures as avatars, and host token-gated meetings. Video recordings can be securely stored on the InterPlanetary File System (IPFS), emphasizing the platformâ€™s commitment to decentralization and security. Led by CEO and Co-Founder Ayush Ranjan and Co-Founder and CTO Susmit Lavania, Huddle01 has an experienced team with 15+ years in RTC and 5+ years of token engineering. Key leadership positions at Huddle01 are held by alumni of BlockScience, ConsenSys, Polygon, Cardano, Persistence, CoinDCX, and Guardian Link. Nodes lead to improved latency Huddle01 Media Nodes â€”the atomic unit of Huddle01â€™s dRTC network â€”provide the necessary bandwidth to encode, decode and route audio/video packets for uninterrupted audio and video communication across the globe. â€”Google Meets and Zoom streams 300 million minutes per day. If Huddle01 captures just 1-5% of this market in the next 12 months, we would have triggered the highest web3 adoption ever.â€” CTO Susmit Lavania explained. While latency issues, or lags and glitches, in the developing world hinder innovation, in truth, they hinder productivity everywhere. Distance education, streaming, gaming and healthcare can all be improved by better internet services. â€”These nodes will power a network that already outperforms the incumbent web2 competitors on latency where there is a large cluster of nodes, and is capable of improving lags across the globe,â€” says Ayush Ranjan, CEO of Huddle01. â€”We are excited to launch this node sale, because as we sell more nodes, the benefits for consumers and businesses will only grow. Node operators are incentivized to run a node, allowing them to create more value for themselves but more importantly, they can actually notice the improvement in latency in all their applications,â€” added Ranjan. Huddle01: Revolutionizing Real-Time Communication with DePIN Huddle01 Media Node Sale features - 46,900 Huddle Media Nodes are available with pricing starting at \$320 - Huddle01 will be doing its Node Sales in 2 Phases - Phase 1 will consist of 20,000 nodes to be sold from the November 6th Whitelist and a Public Sale on November 8 - Phase 1 sale participants are eligible for 2x rewards than Phase 2 participants - Minimum requirement to run the node is a ~250 Mbps Internet connection, however buyers can also delegate to minimize operating expenses - The testnet will launch 2 weeks after the sale completes, with node operators earning up to 5 \$HUDL per day during the testnet - 21% of total TGE supply (200M \$HUDL) will be offered as rewards for active nodes during the testnet phase with immediate vesting and 5% unlocked at TGE Key dates - Whitelist opens â€”9th October - Whitelist Sales â€”6th November - Public Sales â€”8th November More details about the public node sale launching on 6th November can be found here, including how to whitelist: HERE. -END- About Huddle01 Huddle01 is a decentralized real-time communication (dRTC) network for audio and video streaming â€”DePIN for RTC â€”that has clocked in 6 million+ minutes of meetings to date. The dRTC network eliminates the dependency on centralized servers for real-time communication across the globe. Huddle01 is democratizing connectivity over cyberspace by enabling people to access best in class bandwidth without relying on local physical infrastructure. The network has raised \$6M to date and is backed by marquee angels like Balaji Srinivasa, Stanislav Kulechov and leading VC funds like HiveMind, Protocol Labs, Superscript, Consensus and others. Huddle01 makes it possible to build high-quality audio/video applications in minutes. Leveraging its suite of SDKs, multiple web3 applications have integrated the composable Huddle01 SDKs as their video communication layer. The infrastructure (developer SDKs) has been utilized by 100 projects including Lens Protocol, Solana, and CyberConnect. Soon Huddle01 will be onboarding 1.5M active users to their dRTC network with upcoming integrations. Victoria, Seychelles, September 26th, 2024, Chainwire Bitget Wallet, a leading Web3 non-custodial wallet, has surged to become the most downloaded globally, achieving nearly 2 million monthly app downloads in August, according to App Store and Google Play data. The platform now boasts over 30 million users globally, fueled by its mission to simplify Web3 access for the next billion users. During the TOKEN2049 conference, Bitget Wallet unveiled its roadmap for expanding mass adoption of blockchain technology, focusing on integration with Web2 social platforms and a streamlined payment solution. A key driver of Bitget Walletâ€™s explosive growth has been its deep integration with Web2 social platforms, particularly Telegram. By enabling users to create and manage Web3 wallets using familiar logins like email, Google, and Telegram through keyless MPC (Multi-Party Computation) technology, the platform has significantly lowered the entry barrier to Web3. â€”Leveraging Telegramâ€™s massive user base has been a game-changer. Weâ€™ve brought millions of users into Web3 who previously had no exposure to cryptoâ€”, said Alvin Kan, COO of Bitget Wallet. This seamless experience has led to a 2.7x increase in its MPC wallet creation, with over 40% of Bitget Walletâ€™s users now adopting TON-supported MPC wallets. Bitget Walletâ€™s growth has been bolstered by its all-rounded involvement in the TON ecosystem, where popular Tap to Earn (T2E) Telegram mini games on TON network have driven significant user engagement. To mark, for instance, attracted 20 million users in just two months. Bitget Walletâ€™s mobile-first approach has proven particularly effective, with 68% of TON game users now using the wallet app. As a result, Bitget Wallet has contributed over 17% of all active addresses on the TON network. To further onboard Web2 users, Bitget Wallet is preparing to roll out a payment solution that will enable users to seamlessly convert crypto into fiat and spend crypto directly from their wallets on everyday purchases, all while retaining full self-custody of their assets. â€”Our goal is to blur the lines between Web2 and Web3, starting with payments,â€” Alvin explained. â€”By offering crypto-to-fiat conversion directly within self-custodial wallet, weâ€™re enabling users to spend crypto as easily as fiat, which is key to driving broader adoption.â€” Going forward, Bitget Wallet will also focus on fueling the growth of the broader Web3 ecosystem by partnering with major networks like Bitcoin, Ethereum, Solana, Base, and TON. These collaborations, combined with robust incentive structures and an all-in-one platform that supports everything from swaps, potential earning, trading and multi-chain Dapp explorer, are designed to drive usersâ€™ long-term engagement. â€”Weâ€™re building an ecosystem where both users and developers can thrive, aiming at creating seamless experiences that keep users engaged in the long run while driving the adoption of decentralized applications,â€” said Kan. About Bitget Wallet Bitget Wallet stands as one of the worldâ€™s leading non-custodial Web3 wallets and decentralized ecosystem platform. With the Bitget Onchain Layer, the wallet

is well-poised to develop a burgeoning DeFi ecosystem through co-creation and strategic incubation. Aside from a powerful Swap function, Bitget Wallet also offers multi-chain asset management, smart money insights, a native Launchpad, Inscriptions Center, and an Earning Center. Supporting over 100 major blockchains, 250,000+ tokens, and a wide array of DApps, Bitget Wallet is your top wallet for asset discovery and Web3 exploration. For more information, users can visit: Website | Twitter | Telegram | Discord Contact PR team media.web3@bitget.com

The Synesis Foundation, the organization behind Solana's first AI data pre-processing solution, has established a strategic agreement with AirMoney DEGN. The partnership will facilitate the introduction of DePIN-focused consumer hardware in the form of the AirMoney DEGN device. The capabilities of a traditional hardware wallet are enhanced by AirMoney DEGN, which enables users to interact with web3 protocols over a secure DePIN (Decentralized Physical Infrastructure Network) framework. The device may also be used to interact with web3 games and securely trade cryptocurrency assets. The AirMoney DEGN's usefulness will improve and the adoption of crypto hardware inside the DePIN space will accelerate thanks to the cooperation with Synesis Foundation. The Synesis Foundation will develop an application for the AirMoney DEGN device in accordance with the partnership's agreements. This will make it possible for holders of hardware to take part in designated tasks and earn rewards. Owners of AirMoney DEGN may boost their cryptocurrency earnings and support the DePIN economy by assisting Synesis's AI clients with data validation. AirMoney DEGN offers DePIN customers more utility as well as more opportunity to participate in the expanding DePIN economy. Through the partnership with the Synesis Foundation, the use cases that specialized hardware solutions may provide for projects running decentralized physical infrastructure networks will be made more widely known. Synesis CEO Isaac Bang said: "We're just starting to scratch the surface of decentralizing the sourcing and validating of frontier data for companies working on AI solutions. There are certain data validation tasks that require a consensus by a large number of people, and opening these to crypto hardware users will result in a win-win solution for everyone." Krzysztof Gagacki, CEO of AirMoney DEGN, added: "We're delighted to partner with Synesis Foundation to provide greater opportunities for onchain users to earn rewards for participating in the DePIN economy. Not only will this collaboration bring greater utility for existing AirMoney DEGN owners, but it will raise awareness of the benefits that dedicated hardware can bring to this thriving sector of the cytoconomy." Synesis, one of the first AI projects on Solana, has completed more over 1.5 million on-chain transactions linked to AI data tasks. Its clientele and the range of data pre-processing initiatives it offers have grown as a result of the processes. In order to evaluate frontier data for its AI customers, Synesis has introduced a new kind of RLHF (Reinforcement Learning with Human Feedback) campaign. Owners of AirMoney DEGN devices will soon be able to validate RLHF data with their hardware devices to earn rewards. The Synesis Foundation manages, provides services to, and counsels web3 businesses in a variety of industries. The Train2Earn application, under the Synesis One brand, is the primary offering of Synesis Foundation. Businesses and governments may use this solution to expand their AI data requirements, including labeling, tagging, and annotating. The Synesis token (\$SNS) is used by the Synesis One ecosystem for governance and incentives for AI data campaign completion. In addition, Synesis Foundation uses core infrastructure and tools that it has previously established to provide web3 software-based services and support. Among the services offered to businesses in the trading, gaming, and DePIN sectors are blockchain integration, smart contract, and tokenization support.

Vilnius, Lithuania, September 26th, 2024, Chainwire The BITmarkets crypto exchange has published its end-year update for its crypto study on the game-changers for crypto in 2024, entitled "Revisiting the Game-Changers for Crypto". Amongst the listed assets, which include cryptocurrencies and other digital assets with the potential to transform the crypto world as we know it, an emerging newcomer is Sui's blockchain token that is gaining popularity and significance within the decentralized finance (DeFi) applications and technology. Sui's continued innovations and strategic partnerships position it as a leader in the DeFi space. With its low transaction fees, high-speed performance, and growing ecosystem, Sui is set to further expand its influence in the blockchain sector," commented Ali Daylami, Head of Data Analytics at BITmarkets, on why Sui deserved to be listed among this year's game-changers, alongside Bitcoin ETFs, Ethereum, Solana, and Cardano. The list of crypto game-changers is part of the updated 2024 market study. BITmarkets' analysis recognizes Bitcoin's historical significance as a pioneer in the cryptocurrency space, but the exchange does not expect it to be among the assets driving major market shifts in 2024. About BITmarkets BITmarkets is a cryptocurrency exchange that offers 24/7 support in 15 languages. Traders can engage in trading more than 200 cryptocurrencies, as well as gain access to daily market updates and diverse educational materials. For more information, explore bitmarkets.com or visit the exchange's listing on CoinMarketCap.com. Contacts: BITmarkets Spot Trading Services are provided by UAB BITmarkets, which is an authorized virtual currency exchange and depository virtual currency wallet operator in Lithuania operating under license no: 306062346, supervised by the Financial Crime Investigation Service and acting under the trademark BITmarkets. Contact Ali Daylami BITmarkets support@bitmarkets.com

Now is the perfect time to act in the crypto world, especially if you're looking for new investment opportunities. Shiba Inu is showing signs of a big increase, and Dogwifhat is staying strong despite market fluctuations. But it's BlockDAG that's really catching attention. Recently, CEO Antony Turner announced significant rewards for miners, causing a big rise in demand. He also mentioned that miners who hold onto their rewards could earn even more, encouraging long-term loyalty. This news boosted BDAG's presale to a huge \$76 million. As people search for the next big crypto investment, BlockDAG is gaining momentum, with some experts predicting the coin could hit \$1. Shiba Inu Price Prediction: Is a Big Move Coming? Shiba Inu might be getting ready for a big price increase, with experts suggesting it could break past its previous highs. Technical analysis shows that SHIB has strong support around \$0.000013, which could help it gain momentum and move upwards. According to predictions, Shiba Inu could be entering wave 3 of the Elliott Wave Theory, which often leads to strong price movements. If things go as expected, SHIB might even surpass its all-time high. Dogwifhat's steady rise despite market challenges. Dogwifhat (WIF) has seen a 9.23% rise this week, even as the overall market struggles. While many coins fell, WIF held strong, and its trading volume went up by 23.85%, showing increased interest from buyers. The latest forecast for Dogwifhat looks positive. If the trend continues, WIF could break through the \$2.0 resistance level. However, if the market takes a turn, it might fall to \$1.2. For now, WIF is staying steady and showing promise. Mining for the Long Run: BlockDAG's Plan to Reach \$1 by 2025 BlockDAG is making big moves in the crypto world, not just keeping up but leading with fresh ideas. In a recent AMA, CEO Antony Turner shared an exciting plan: miners can earn up to 300 million in rewards, and those who hold onto their rewards longer can earn even more. The idea is simple: if miners hold their rewards, the value could increase as demand goes up and supply becomes tighter. This approach helps reduce price swings and aims for steady growth for the BDAG coin. Turner's strategy links miner rewards to BlockDAG's long-term success. Instead of just taking a quick payout, miners are encouraged to see their rewards as investments in the future of the network. This smart move is helping strengthen BlockDAG's position in the market. The results are already showing: that 12,300 mining units have been sold, and presales have hit an impressive \$76 million. This growing demand shows that miners trust BlockDAG's vision for the future. By holding onto their rewards, they're not just waiting; they're part of a strategy that could see BDAG hit \$1 by 2025. In Summary while Shiba Inu is preparing for a price surge and Dogwifhat stays strong in uncertain markets, BlockDAG is capturing attention. CEO Antony Turner's plan offers miners substantial rewards and encourages long-term loyalty. This has led to a big increase in interest, and some projections suggest BDAG could hit \$1. BlockDAG presents a promising opportunity for anyone looking to benefit from the growing crypto market. - Banana Gun will refund \$3 million stolen from users after a Telegram bot exploit. - The bots have been reactivated with enhanced security measures following a thorough investigation. In a recent post on X, Banana Gun announced plans to refund \$3 million stolen from users affected by a Telegram bot exploit last week. The incident impacted eleven users, with hackers stealing 563 ETH from 36 separate wallets associated with the bot. Notably, Banana Gun confirmed that no tokens will be sold to cover these reimbursements. The attack specifically targeted experienced traders and crypto veterans. Individuals known for their social presence and trading expertise, making them harder to deceive. Victims reported witnessing the attacker manually transferring ETH from their wallets while they interacted with the bot, receiving notifications in real time. - Banana Gun on its official X post stated, "After a thorough investigation by the Banana Gun development team and outside experts, we identified a potential vulnerability in the Telegram message oracle we use, which may have led to the exploit." Both the Ethereum Virtual Machine (EVM) and Solana bots were affected, despite having distinct codebases and operating independently. After the attack, the bot was shut down, preventing further exploitation. Banana Gun has since patched the vulnerability and implemented enhanced security measures to protect users moving forward. The bots have now been reactivated, with assurances that new safeguards are in place to prevent similar incidents in the future. Users are encouraged to stay vigilant and report any suspicious activity. Banana Gun Token Plummets After Major Flaw The Banana Gun token has experienced a severe crisis following a major flaw discovered a week ago. Once valued at approximately \$8.7, its price has plummeted to near insignificance. Currently, the token's total market cap stands at just \$0.0000001504, with 0% liquidity. Banana/WBNB is trading at an astonishingly low price of \$0.00000000000004172. The circulating supply has already reached the total supply of 1.00 billion tokens. In the last 24 hours, trading volume was a mere \$0.9804, reflecting the drastic loss of interest and confidence among investors in the token's viability. Highlighted Crypto News Today:

- Sui's price recently broke its resistance at \$1.5 and has shown significant upward movements. - The altcoin's daily trading volume surged 66.61% as per CMC data. Leading stablecoin issuer, Circle announced its decision to move to the Sui Network last week. With that latest announcement, the Sui ecosystem has been quite vibrant in recent times having initiated several projects. Subsequently and due to many other reasons, the SUI token has exhibited a price rally this past week. Zooming out over the sector, the last 24 hours have been modestly bullish as prices attempt to maintain the recent turn of events. Bitcoin is currently facing resistance at \$64K while Ethereum combats the \$2.7K levels. Other altcoins have also recorded mild price increases over the past day, at the time of writing. Notably, prominent altcoin and Sui Network's SUI token recorded an additional 10.48% price increase in the last 24 hours. The token has now climbed past its \$1.5 resistance level and is trading at the \$1.7 range. Sui price maintained the recent upward trend apart from a brief bearish appearance momentarily during the day. At the time of writing, SUI was trading at \$1.7320 as per CMC data. Additionally, the altcoin hit a 175-day high of \$1.7929 on September 24 after which it fluctuated downward moderately. This has caused a buying spree among investors propelling Sui to enter an overbought market situation. The token's RSI standing at 82.38 highlights the aforementioned market sentiment. Will SUI Price Hit a New ATH in the Coming Months? Prominent market analyst Ali stated recently that Sui's (SUI) price actions resemble Solana's movements before its bullish breakout in 2021. If the altcoin sustains its price rally, then it can be expected to surpass its current ATH at \$2.18. However, on inferring the daily price chart of the token, SUI might face resistance at \$1.7692 and \$1.9565. Meanwhile, Sui's Moving Average Convergence Divergence (MACD) shows that the token is currently on a bull run. The signal line stands above the MACD line indicating the positive price movement as per TradingView data. Zooming out, over the past week Sui's price performance stands at 47.67%. Additionally, this has resulted in a 78% price increase over the past 30 days. This massive price increase has garnered SUI immense market attention. Highlighted Crypto News Today:

Historically referred to as "Up to Berá" in the bitcoin industry, October is almost here, and the market mood is strengthening following the most recent Federal Reserve rate cut. Many cryptocurrencies show great promise for new investors eager to join as they prepare for what might be a major surge. Whether your passion is meme coins or real-world asset tokenization, October 2024 is predicted to be an exciting month for the crypto market, and these four currencies might be the best choices for beginners. Rexas Finance Stage 2 Presale Sold Out Ahead of Schedule In the real-world asset (RWA) tokenization space, Rexas Finance (RXS) is leading the way in innovation by enabling investors to tokenize and trade commodities, and other real-world assets. The RXS Finance is the first of its kind in the world of real-world asset tokenization, offering a secure and transparent platform that token values are anticipated to skyrocket to \$0.20 once it is listed on exchanges. The project's easily accessible tokenization tools, such as the multi-chain yield optimizer Rexas Treasury and the Rexas Token Builder, have drawn attention. Thanks to these features, investors can now more easily participate in the tokenization revolution and generate passive income. Rexas Finance is also encouraging participation with a \$1 million giveaway, which will award 20 lucky winners \$50,000 each. In October 2024, Rexas Finance might be a good choice for novices seeking long-

term potential. Shiba Inu Poised for a Major Breakout The second-largest memecoin, Shiba Inu (SHIB), has been consolidating over the past 75 days, but a breakout could be imminent. SHIB has tested the \$0.000014416 support zone several times without closing below it, and it is currently trading close to it. With indications such as the Bollinger Bands broadening and the wave trend momentum oscillator forming a golden cross, the price action now points to a possible breakout. Renowned for its devoted community and whale activity, SHIB has seen significant investment interest in recent months. There is currently more buy-side liquidity than sell orders in the order books, indicating that the market is confident that a rise is imminent. SHIB is a great option for novice investors who wish to take advantage of its upside potential in October, as some analysts estimate profits of up to 118% if the stock breaks out as anticipated. Pepe Coin Flashes Bullish Signal Pepe Coin (PEPE), which has tremendous growth potential for Q4 2024, has been in the news lately for its performance in the memecoin space. Pepe is ready for a 30% rally in the upcoming weeks after flipping a crucial support level in response to a spike in trading volume and positive market factors. Bullish momentum is shown by the Relative Strength Index (RSI) rising above the midline and the Chaikin Money Flow (CMF) indicator showing increasing capital inflows. Whale activity has contributed to Pepe Coin's growth, as huge transactions totaling more than \$100,000 are becoming more frequent. These changes have played a part in PEPE's recent price surge. Should the optimistic feeling persist, PEPE's value may increase to \$0.00001, providing investors with significant rewards. Pepe Coin offers a potential choice for novices seeking a high-risk, high-reward investment as October draws near. Whale Activities to Spark Dogwifhat Price Rally Another memecoin that has gained popularity recently is Dogwifhat (WIF). Dogwifhat is now trading at \$1.78, showing indications of bullish momentum as market activity has increased and the price has been rising steadily. According to analysts, WIF is expected to hit \$5 soon, especially if it keeps gaining from larger market trends and the current memecoin surge. Dogwifhat's growth has also been significantly influenced by whale activity, with well-known investors purchasing millions of WIF coins via websites like Kamdn. Furthermore, growing purchasing pressure is indicated by market indicators like the Chaikin Money Flow (CMF), indicating that more money is entering WIF than is exiting it. Dogwifhat might be a profitable investment for novices hoping to profit from the meme coin craze, especially if it breaks through its present resistance level and moves toward \$5. October 2024 Could Be a Game-Changer Rexas Finance, Shiba Inu, Pepe Coin, and Dogwifhat stand out as some of the finest cryptocurrencies for beginners as we head into October, a month that has historically seen increases in the cryptocurrency market. From meme currency frenzy to tokenization of real-world assets, each presents special prospects. With the memecoin market picking up steam and Rexas Finance already displaying impressive presale results, this may be the ideal moment for new investors to jump in and take advantage of what looks to be an exciting month in the cryptocurrency space. For more information about Rexas Finance (RXS) visit the links below: - Website: <https://rexas.com> - Win \$1 Million Giveaway: <https://bit.ly/RexasIM> - Whitepaper: <https://rexas.com/rexas-whitepaper.pdf> - Twitter/X: <https://x.com/rexasfinance> - Telegram: <https://t.me/rexasfinance> Disclaimer: TheNewsCrypto does not endorse any content on this page. - POPCAT becomes Solana's first memecoin to hit \$1 billion market cap. - Memecoins like DOGE, SHIB, and PEPE surged 3%-15% in 24 hours. The cryptocurrency market, fraught with regulatory battles over ETF approvals, high-profile founder arrests, and large-scale hacks, has been in a state of turbulence. As bears held their grip, price rallies became a rarity. However, anticipating the beginning of October, dubbed "acmptober," has brought a breath of fresh air. The global market cap is up 2%, trading volume has surged by 5%, and Bitcoin has reached a 29-day high. Amidst this resurgence, memecoins have also captured attention. Major tokens like Dogecoin (DOGE), Shiba Inu (SHIB), Pepe (PEPE), Dogwifhat (WIF), and Bonk (BONK) saw price surges ranging from 3% to 15% in the past 24 hours. However, the spotlight has shifted to POPCAT, the first Solana-based memecoin to hit a \$1 billion market cap, achieving an all-time high (ATH) of \$1.07 after a 13% rise in the last 24 hours. Trading volume for POPCAT also jumped by 31%, with the token gaining 44% over the past week. Moreover, analysts report that the momentum suggests further gains for POPCAT, with projections of it potentially reaching \$2 by year-end. This would result in a 100% gain if market conditions remain favourable. Additionally, POPCAT's open interest has reached a new ATH, and funding rates are positive, reinforcing a bullish outlook. When Will POPCAT Hit \$2? Technically, POPCAT remains in an upward trend. The 9-day Exponential Moving Average (EMA) sits at \$0.9055, while the Relative Strength Index (RSI) at 63 indicates that it is approaching an overbought territory. Key resistance levels are anticipated at \$1.20 and \$1.71, with potential support around \$0.8703. As traders closely watch its movement, POPCAT's ability to break through these critical levels will determine whether it can sustain its bullish momentum or face a possible pullback. Highlighted News Of The Day Philippines Youth Introduced to Blockchain by Government Agency

- Individuals to launch a memecoin must take note of several necessary actions before the project launch. - The memecoin sector has shown a surge in new project launches in the past months. The revolutionary introduction of Decentralization has equipped creators with enhanced tools for development and revenue generation. In recent times, numerous enthusiasts have turned to exploring memecoins to unleash their creative skills. However, DeFi has expanded beyond utility tokens and has become inclusive through memecoins, allowing any creative individual to contribute to the sector. The past few months have seen widespread incorporation of memecoins within the cryptocurrency sector. Let's unravel the mystery behind this comical digital asset by understanding how to launch memecoins, and the facets surrounding it. What was the May Memecoin Mania? While memecoins have always been on the market, in May 2024 they took over the crypto spotlight. During that time, multitudes of crypto community members released meme tokens and the market saw huge inflows in new tokens. Additionally, prominent celebrities began launching their own meme tokens. Initiated by popular reality TV personality, Caitlyn Jenner, the memecoin frenzy saw endorsements from popular singers and celebrities across different platforms. Notably, Caitlyn Jenner launched her memecoin JENNER on May 28. Following her, other celebrities began shelling memecoins. Prominent instances include Iggy Azalea's MOTHER token and Andrew Tate's DADDY token dispute. Apart from this, heavyweight champion Hulk Hogan was also involved in the memecoin shelling. Most of the aforementioned celebrities proceeded to launch their memecoins on Solana's pump.fun platform. The platform enabled individuals to release their tokens in a simplified manner. However, the May month also saw several rug-pull scams with celebrity tokens. This caused community members to abstain from celebrity-launched memecoins as they suspected scams associated with the tokens. Furthermore, a new category of tokens called the Politifi memecoins have also sprung up reflecting the current US political landscape. Politifi memecoins have inspired ways to represent societal circumstances within the cryptocurrency sector which can be expected for implementation in the coming months. What is the Memecoin Launch Checklist? A memecoin, similar to any creation, first begins with an idea. When launching your token, it requires a concept that stands as core to the memecoin project. Following this, the individual can begin to design their token, specifying and customizing it according to the concept. The memecoin concept and design must be optimized in order to make it appealing. Secondly, the creator needs to choose a particular blockchain on which you plan to launch your token. Several blockchains, presently, provide platforms acting as memecoin launchpads. Ethereum, the aforementioned Solana, Polygon, Binance Smartchain, and Tron Network are some of them. The Operational Checklist " Smart Contracts, White Paper & Tokenomics Every memecoin requires a smart contract for deployment and transactions within the blockchain. While other steps in launching a memecoin may not require full-fledged coding, a smart contract will need to be coded. In such a case, individuals can employ blockchain developers to prepare a smart contract and get it audited. Moreover, when you launch a memecoin or any token, it is customary to write a white paper. The white paper is a documentation outlining all the important facets of your memecoin project. When a project includes a white paper it communicates authenticity and makes it more professional. Thirdly, and importantly, token distribution or tokenomics is a memecoin or any token's crucial step before launch, is determining its tokenomics. Tokenomics of a memecoin informs the crypto community about the project's token allocation. Additionally, the distribution entails your marketing strategies and draws market attention to your memecoin project. Enhance your Memecoin with a Burn Mechanism A burn mechanism destroys tokens permanently from supply thus maintaining a limited supply. This ensures a limited token supply thus creating scarcity in the market which helps maintain price levels. One of the leading Dog-based memecoin Shiba Inu (SHIB), is known for its burn mechanism. Additionally, other memecoins such as PEPE and BONK also have a burn mechanism instilled to alter the supply of tokens. On the other hand, memecoins also have a minting option where new tokens can be minted to be added to circulation. How Do You Sell Your Memecoin? A memecoin launch isn't limited to designing and operational aspects. A key facet of a memecoin launch is marketing and listing the token on exchanges. In order for your token to succeed in the crypto market, you must grab investors' attention. This requires an optimized marketing strategy that begins with the token idea itself. Additionally, when designing your token it is necessary to keep in line with the current trends that will garner attention. For instance, DOGE, when it was first launched, was inspired by the trending Kabosu dog and saw massive interest from the crypto community. Secondly, a community is a crucial element for any memecoin. When deploying your token, initiating and creating an active community will play a prominent role in the success of your memecoin. Additionally, when your memecoin includes a community it will aid in further project expansions both in terms of blockchain and token utility. Furthermore, a second facet within marketing is getting your coin listed in different crypto exchanges. Every exchange has a particular set of regulations that the cryptocurrency must adhere to for being listed. Some of the prominent crypto exchanges to keep in mind include " Binance, Raydium, KuCoin, Coinbase, and Uniswap. Once listed the token goes live for investors to begin trading, officially launching your memecoin on the cryptocurrency market. Challenges that You Might Face When Launching a Memecoin During the May memecoin frenzy, as aforementioned, several rug-pull scams occurred. This has caused a distrust among community members towards newly launched tokens. This has been one of the major challenges that memecoin creators have faced in recent times. Additionally, another crucial issue might be the memecoin sector having lost its spotlight over the past two months. Towards the end of June, the community began speculating whether the memecoin season had come to an end. This was due to the reduction in performance as suggested by Dune Analytics data in May and June. Other challenges might be encountered in technical fronts and garnering attention from the community. Creators often tend to resolve these challenges by adopting required strategies at the time of the problem. Security & Regulatory Awareness Finally, one important aspect that you need to keep in mind is your memecoin's security. Several memecoin wallets and custody hacks have been reported in the past months. Thus when creating a token, the individual must formulate contingency plans and enhance security measures. Furthermore, once you create a token you must hold a strong knowledge about regulatory compliance to avoid any scrutiny from regional and national regulatory bodies such as the US SEC. Moreover, compliance with regulations also adds to the authenticity of the memecoin project. Conclusion In the present cryptocurrency landscape memecoins hold a significant position as digital assets. Apart from witnessing an influx of investors, it has also seen a surge in individuals launching their tokens. Thus, launching a memecoin holds immense scope in current circumstances amid an expanding and diversifying crypto ecosystem. - Sam Bankman-Fried's neurodivergence, including ASD and ADHD, played a crucial role in his trial's proceedings. - Denying ADHD medication for SBF during key trial phases hampered his ability to focus. Sam Bankman-Fried, was once a prominent figure in the cryptocurrency world. Claimed in November 2023 that he had become "the most hated man on earth" due to his role in the collapse of FTX. He was sentenced to 25 years in prison and fined \$11 billion after being found guilty of wire fraud and conspiracy. Upon Sam Bankman-Fried's release in 2022, Bankman-Fried was mandated to undergo mental health and substance abuse counseling. It was as part of a plea agreement. Despite his initial hopes for leniency, he filed an appeal against his conviction on seven felony counts and the 25-year sentence. A process that has faced significant challenges. In a recent amicus brief supporting his appeal, a group of doctors highlighted the impact of Bankman-Fried's neurodivergence on his trial. Diagnosed with Autism Spectrum Disorder and Attention Deficit Hyperactivity Disorder (ADHD). They argue that his conditions contributed to difficulties during legal proceedings. "For example, his cognitive and communication style" which includes seeking clarity when confronted by what he perceives as ambiguous questions, and giving expansive, detailed answers in the interest of accuracy "is characteristic of ASD". The conclusion states that Neurodivergence significantly influenced SBF's trial. And that it should be taken into account when evaluating his appeal. Neglecting Medication Worsened SBF's Trial Impact The lack of appropriate management for Mr. Sam Bankman-Fried's ADHD during crucial phases of the trial. Significantly heightened the prejudice against him. Specifically, during the first three weeks when the government presented its case. He was denied access to the ADHD medication essential for maintaining focus. As a result, he was not only deprived of many of FTX's documents necessary for his defense. But was also unable to concentrate on the evidence presented by the prosecution. Highlighted crypto News Today: Bybit Launches First Shariah-Compliant Crypto Islamic Account

In 2024, meme coins have been making waves, with PEPE and Simon's Cat at the helm of market fluctuations. PEPE Coin, after a 6.69% September dip,

is poised for a 25% surge, while Simonâ€™s Cat has already soared 85.09% since August. Not to be outdone, BlockDAG is crafting its niche by linking crypto with the sporting world through lucrative deals, raking in \$74.5 million in presale and stirring rumors of a Premier League deal. Market gurus now see BlockDAG potentially reaching a \$1 valuation, translating to an immediate 5500% ROI from todayâ€™s \$0.0192 price, and envisioning a monumental 30,000x ROI over time. PEPE Coin Price: A 25% Rally in Sight? PEPE Coin has shown a promising buy signal recently, hinting at a potential 25% rally. Despite its current downturn this September, market optimism remains high, bolstered by data from Coinglass that shows a spike in long positions. Moreover, increased activity from large holders moving substantial PEPE volumes into wallets signals a growing confidence in its price recovery. If this buying trend persists, PEPE Coin might surpass the \$0.000008 resistance level and target \$0.000009. Simonâ€™s Cat 2024 & 2025 Forecast: Continued Growth Expected Since its introduction, Simonâ€™s Cat (SCAT) has achieved remarkable growth, buoyed by its affiliation with the popular YouTube cartoon. With a current trading price of \$0.000020, analysts see a trajectory reaching \$0.000025 by the end of 2024 and \$0.000039 by the close of 2025. The coinâ€™s strong community backing and brand visibility suggest it is well-positioned for sustained upward movement. BlockDAGâ€™s Third Potential Soccer Collaboration: Massive ROI on the Cards? BlockDAG has had an eventful 2024, securing two significant soccer-related deals. A \$10 million collaboration with Germanyâ€™s Borussia Dortmund and another robust agreement with Italyâ€™s Inter Milan have pushed BlockDAGâ€™s presale beyond \$74.5 million. Rumors now suggest that a third monumental deal with a Premier League club is forthcoming, which has fans and buyers alike buzzing about future implications. With a global soccer fanbase of 2.3 billion, BlockDAGâ€™s strategic alliances have not only included significant matchday LED displays but also extensive social media campaigns and exclusive perks for coin holders. The excitement around these deals and the speculated third partnership is fueling predictions that BDAG could achieve a \$1 valuation by 2025. Given the current price of just \$0.0192 in its latest presale batch, those getting involved now could see a dramatic 5500% ROI. The ongoing expansion and active market engagement suggest that the projected record-breaking ROIs are increasingly within reach. Summing Up While PEPE Coin aims for a rebound and Simonâ€™s Cat enjoys its ascent, BlockDAG is poised to deliver significant returns to its early backers. With established partnerships with Borussia Dortmund and Inter Milan and the potential for a Premier League deal, BlockDAG is strategically positioned for a forecasted \$1 price point by 2025. At the current rate of just \$0.0192, investors stepping in now could realize a 5500% ROI. - Bitcoin dominates inflows; Ethereum sees a fifth consecutive week of outflows. - U.S. leads inflows; Germany, Sweden, and Canada face net outflows. Digital asset investment products experienced net inflows of \$321 million for the second consecutive week, according to CoinShares. The surge was largely attributed to the U.S. Federal Reserveâ€™s decision to cut interest rates by 50 basis points (bps), which was viewed as a dovish move by the market. Total assets under management (AuM) rose by 9%, while weekly trading volumes also increased by 9% to \$9.5 billion. Bitcoin-based products led the inflows, attracting \$284 million last week. However, the bullish sentiment surrounding Bitcoin also drove net inflows of \$5.1 million into short-Bitcoin products. It reflects continued interest in hedging strategies. Meanwhile, Solana-based investment products maintained their positive streak, bringing in \$3.2 million in net inflows, bolstered by announcements at the Solana Breakpoint conference in Singapore. Conversely, Ethereum-based products registered net outflows of \$29 million, marking the fifth consecutive week of outflows for the second-largest cryptocurrency. Behind Inflows And Outflows The ongoing Ethereum outflows were primarily linked to Grayscaleâ€™s Ethereum Trust, which has faced stiff competition from newly launched U.S. spot Ethereum ETFs. Since the trustâ€™s inception in July, Grayscale has recorded \$2.8 billion in outflows, compared to \$2.2 billion in inflows into the spot ETFs. Regionally, U.S.-based investment products led the inflows, with \$277 million added. It is followed by Switzerland, which saw \$63 million in net inflows, the second-largest weekly inflows this year. In contrast, Germany, Sweden, and Canada experienced outflows of \$9.5 million, \$7.8 million, and \$2.3 million, respectively. The continued inflows into digital asset products signal renewed interest following recent market volatility, particularly in the wake of the Federal Reserveâ€™s monetary policy shift. Investors are closely monitoring further developments to gauge the long-term impact on digital assets. Highlighted News Of The Day Australia Eyes Stricter Licensing for Crypto to Boost Protection

Savvy investors are scanning the landscape for cryptocurrencies that promise innovative technology and strategic partnerships and demonstrate significant growth potential. Hereâ€™s our latest roundup of the top cryptos to buy now, led by the trailblazing project, BlockDAG: 1. BlockDAG (BDAG) Emerging as a frontrunner in 2024, BlockDAG distinguishes itself through a pioneering approach to enhancing blockchain scalability and decentralization. Presale Success: This project has captivated the market by raising a staggering \$74.2 million during its presale, marking an 1820% price increase from its initial offeringâ€”a clear indicator of strong market confidence. Strategic Partnerships: BlockDAGâ€™s alignment with top European football clubs like Borussia Dortmund and Inter Milan broadens its exposure and integrates it more deeply into mainstream markets. Collaborations with prominent figures like Alex Pereira also enhance its visibility and credibility. Attractive Price: BlockDAGâ€™s Batch 23 offers an attractive entry point, with coins priced at just \$0.0192. Following the highly anticipated Testnet launch, the project is experiencing a surge in buying activity, particularly from top crypto whales, signalling strong confidence in its potential. 2. Bitcoin (BTC) Bitcoin maintains its status as the cornerstone of the crypto market, representing a dependable investment avenue. Known as the digital equivalent of gold, it offers a hedge against inflation and retains a dominant market presence. Market Prospects: The anticipation around Bitcoinâ€™s upcoming halving in 2024 will likely tighten supply and propel its price upwards, reaffirming its position as a critical asset for long-term investment portfolios. 3. XRP (XRP) XRP has recently gained significant attention following a favorable legal resolution with the SEC. This cryptocurrency enables swift and cost-effective cross-border transactions, a utility increasingly recognized by financial institutions globally. Market Reentry: XRP enjoys renewed interest and price recovery post-litigation, underscoring its viability and enduring demand within the financial sector. 4. Ethereum (ETH) Ethereum continues to be indispensable in the realms of DeFi and NFTs, driven by its robust smart contract functionality. Upcoming enhancements aimed at reducing transaction costs and improving transaction speed further its appeal. Ecosystem Growth: The shift towards Ethereum 2.0, transitioning to a proof-of-stake model, promises greater network efficiency and sustainability, making Ethereum a more attractive option for developers and investors alike. 5. Solana (SOL) Tagged as the potential â€œEthereum killer,â€ Solana offers an ultra-fast, low-cost operational framework that is appealing for both DeFi and NFT applications. Innovative Edge: With its capability to handle thousands of transactions per second, Solana is attracting a growing number of developers to its platform, which could significantly impact its market standing and valuation in the future. 6. Binance Coin (BNB) Binance Coin is integral to the operations of the Binance exchange ecosystem, providing transactional utility that includes trading fee discounts and token sale participation, ensuring its ongoing demand. Strategic Value: Regular coin burns by Binance decrease BNBâ€™s supply, potentially enhancing its value as the exchange continues to expand its services globally. Which Best Crypto Will You Buy? The highlighted cryptocurrencies offer diverse investment opportunities this September. From BlockDAGâ€™s groundbreaking technology and impactful partnerships to the foundational roles of Bitcoin and Ethereum, and the innovative promises of Solana and XRP, each provides a unique value proposition. Whether you are an experienced investor or new to the crypto space, these picks deserve consideration as you aim to capitalize on the dynamic crypto market this month. A Satoshi-era Bitcoin whale who has a history of holding early Bitcoin where the entire crypto started, has recently revealed what three altcoins he prefers for the long term, and it is surprisingly not including Ethereum. Rather, this whaleâ€™s portfolio is concentrated on Rexas Finance (RXS), Toncoin (TON), and Solana (SOL) all with different potentials for growth and solid fundamentals. Rexas Finance (RXS): An Emerging Star With Real-World Use Cases The trading price of Rexas Finance, which is currently in its second stage presale, is placed at \$0.04. The Token is still at a nascent stage of development; however, it still managed to capture the attention of investors and industry professionals, owing to its novel approach towards RWA Asset Tokenization. Because of this, Rexas Finance stands out amongst a few such projects that manage to merge the virtual and the physical world, allowing for real estate, art or any other real asset to be fractionally owned through the use of tokenization. Some of the core competitive edges of Rexas Finance are: Asset Tokenization: Investment in traditionally illiquid assets is made possible through the ease of trading them on the blockchain which Rexas Finance offers. Defi Tools and Ecosystem: In aspect of this matter, the platform also features a token builder and a launchpad for simple tokenization Strong Incentives: The project is now organizing a \$50,000 USDt giveaway promotion and encourages participants to gain bonus entries by completing different quests which will increase the communityâ€™s support and participation. Rexas Finance is attracting early investors who are already bullish about the real use cases and the DeFi opportunities the project is going places with such a strong base and such amazing motivators. Toncoin (TON): Web3 and Cross-Chain Vision The price of Toncoin (TON) currently trades at about \$5.70 and for sure is one of the evolution of Web3. The whole idea of Toncoin was first initiated by Telegram and now it has become the core of the community, thus Toncoin has become a pioneer of dApps, smart contracts, and cross-chain swap technology. The focus of the Toncoin ecosystem is to develop the areas of connecting all chains and cross-chain asset transfer. What makes Toncoin stand out? Web3 development? Toncoin has accomplished decent progress in the creation of DApps and services of the next-generation internet which is still elusive. Strong Community with Developer Network: Adding development and continuing with a burning community, Toncoin is making progress in extending its ecosystem further. Scalability and Speed: Fast transactions with very small costs are offered by Toncoin which is very beneficial for both developers and users. The evolution of blockchain technology helps the development of Toncoinâ€™s cross-chain functions and Web3 orientation so that the company will account for much of the market in the years ahead. Solana (SOL): The High-Performance Blockchain For \$138, Solana has already demonstrated the capacity to scale as it can process thousands of transactions within a second and at a very small cost. It is currently one of the fastest blockchains supporting DeFi, dApps, and NFT services which offer fast, cheap, and efficient scalability. Due to the explosive growth of web3 traffic, many developers flock to Solana and many people praise the comfort of decentralized apps on this chain without congestion, which is a common issue on many blockchains including Ethereum. High-Speed and Scalability: Solana is a leader in these areas. Both its high throughput and low fees allow developers to build overflows into Solana. Why Solana still rules: Unmatched Efficiency and Amount of Fees: The basic reason why users do not have latencies during their interactions with Dapps when they are using Solana is the fact that there is high throughput in the efficient operation of the system. NFT and DeFi Boom: Over the past year, however, the Solana blockchain has evolved into one of the leaders, plunging into the versatility of NFT and DeFi space with a plethora of projects being launched. Developer-friendly Environment: The prerequisites of the Solana framework are primarily for developers, which triggers the development of new extreme dApps. As the developer community is migrating toward Solana due to its performance benefits, the blockchain is likely to maintain this momentum, to consolidate its place as a top ten cryptocurrency within the space. For what reason does the Whale Opt for These 3 Altcoins It is the guided strategic thinking that drives this Bitcoin whale to consider Rexas finance, Toncoin, and Solana after Bitcoin. The reason for this optimism is that every one of these tokens has something unique that will be in line with the anticipated advancements in the field of digital currencies. Rexas Finance is focused on a new area â€” tokenization of physical assets and provides a new trend on how traditional assets can be unlocked and further blockchain and crypto mass adoption can exist. Toncoin can respond to this trend and provides web3 applications and cross-chain solutions which are undeniably the future of the multi-cross-chain ecosystem. With its well-known scalability and affordable fees, Solana continues to outrank the DeFi and NFT space, providing confidence in its potential growth in the longer term. Conclusion In the crypto market, looking out for long-term winners can be a daunting task but one can look out for disproportional returns on investment by examining long-term strategies of investments that look at projects with real utility, strong fundamentals, and active development teams. The enormous potential of these projects is underlined by this Satoshi-era whale faith in Rexas Finance, Toncoin, and Solana. Except for the ability to change their perspective on the market and try new ideas, taking risks in this specific area is replete with hazards â€” these three altcoins however give genuine hope to long-term prospects. It doesnâ€™t matter if your goal is to invest in a market that has exposure to various assets or simply looking for a market opportunity then these tokens â€” Rexas Finance, even more so at the presale price of \$0.04, are very attractive. - A contingency plan should the need arise was the BOCat's stance on CBDCs. Both high-level and ground-level investigations were conducted by the bank itself. Updates on the Bank of Canada's (BOC) website indicate that the central bank is halting development of CBDC for retail use. Although a wholesale CBDC was not mentioned in the statement, it was stressed that research was ongoing. Since the Bank of Canada has already spent a lot of time studying CBDCs, it is moving on to other, more urgent matters. A contingency plan should the need arise was the BOC's stance on CBDCs. As the bank is ready to take on additional duties, its priorities are changing. Shift of Focus Particularly worth mentioning is the fact that the retail-focused Real-time Rail payment system is still in the development stages. Payments Canada is the group responsible for running the country's payment clearing and settlement system. The Bank of Canada is one of more than a hundred members of the group. The Retail Payment Activities Act of 2021 also mandates increased oversight of retail payments by the Bank of Canada. The legislation states that in November, the central bank must start registering 2,500 small payment service providers that were previously exclusively regulated by anti-money-laundering laws. In 2025, the statute specifies that operational risk requirements must be enforced. Collaborating with the Bank for International Settlements (BIS) and the Digital Currency Initiative at Massachusetts Institute of Technology, the BOC has conducted CBDC research. Both high-level and ground-level investigations were conducted by the bank itself. The bank discovered time and time again that the general population in Canada was uninterested in CBDCs. And that the new currency would bring further problems to the economy and the general people. The bank has said that, despite its shifting focus, the CBDC research will prove to be important in the event that Canadians, acting via their elected officials, determine in the future that a digital Canadian currency is desired or necessary. - SEI breaks 27-day high amid DeFi growth and falling wedge breakout. - Liquidity and funding boost confidence in SEI's decentralized finance ecosystem. The cryptocurrency market has been highly volatile since the start of the month, with Bitcoin hitting a 25-day high yesterday, sparking a brief surge. However, today the overall market has dipped, with total market capitalisation down 0.39% and trading volume dropping by 28%. Despite the red across most altcoins, one coin has stood out: SEI (SEI) which saw a 5% increase in the last 24 hours, reaching a 27-day high of \$0.3747. Currently, SEI is trading at \$0.3665, with its trading volume rising 28% in the last day. Over the past week, SEI has surged by 23%, largely driven by bullish technical indicators and developments within its DeFi (decentralised finance) ecosystem. The upward movement follows a confirmed breakout from a falling wedge pattern, a bullish reversal signal often indicating a transition from a downward trend to an upward one. This breakout has sparked optimism among investors. Moreover, the falling wedge pattern, marked by converging downward-sloping trendlines, was breached upwards, signaling a shift in momentum. Historically, such a breakout indicates further upward movement, suggesting that SEI's previous bearish trend might be behind it. Beyond technical factors, SEI's price surge has been bolstered by significant activity within its DeFi space. Can SEI Maintain the Bullish Momentum? While the technical breakout and increased liquidity have boosted SEI's performance, analysts are keeping a close eye on resistance levels. The mid-range resistance at \$0.32, tested on 15 September, held strong, preventing further gains. Yet, SEI's bullish price action remains strong, with the daily RSI (Relative Strength Index) climbing back above 63, signaling buyer dominance. However, the OBV (On-Balance Volume) and CMF (Chaikin Money Flow) have yet to confirm a definitive buy signal, indicating some caution in the market. However, recent macroeconomic factors, including the Federal Reserve's decision to cut interest rates by 50 basis points, have improved sentiment across the market, providing further price support. As it approaches its next key liquidity pocket at \$0.43, investors are watching closely to see whether the token can maintain its momentum. Highlighted News Of The Day Coinbase Introduces cbBTC Integration with Solana at Breakpoint 2024

- Among yesterday's inflows, Ark Invest and 21Shares' ARKB received \$81.07 million. - U.S. bitcoin funds have had a net inflow of \$17.60 billion since their start in January. Prior to Thursday's net inflow of \$158.21 million, spot bitcoin exchange-traded funds in the US had a net outflow of \$52 million. Among yesterday's inflows, Ark Invest and 21Shares' ARKB received \$81.07 million, the most, according to SoSoValue statistics. Net inflows of \$49.88 million were recorded by Fidelity's FBTC, while Bitwise's BITB had positive flows of \$10.36 million. Thursday witnessed \$9.54 million inflows into Grayscale's Bitcoin Mini Trust and \$7.35 million into EZBC, run by Franklin Templeton. Even though seven funds had no transactions at all for the day, no money left any of the twelve bitcoin ETFs. U.S. bitcoin funds have had a net inflow of \$17.60 billion since their start in January. And on Thursday, that amount was \$1.44 billion in total daily transaction activity. Net inflows of \$5.24 million were recorded by spot ether ETFs yesterday. With all of that money coming from BlackRock's ETHA fund. Thursday was a dry day for the other eight funds. Positive Momentum Total daily trading volume for the ether funds increased to \$250.84 million from \$221.88 million on Wednesday. A total of \$10.35 million has been lost by U.S. Ethereum ETFs since their inception in July, according to statistics from SoSoValue. At the time of writing, the price of Bitcoin was \$83,338 as per data from CMC. Following a recent low of around \$52,800 on September 6, the value of the biggest cryptocurrency in the world has been increasing in recent weeks due to good macroeconomic signs. As of right now, the price of bitcoin is challenging the 200-day simple moving average (SMA) on the daily chart, indicating a robust short-term rising trend. Highlighted Crypto News Today: Solana Trades Above 20-day EMA and 50-day SMA, SOL Shows Upward Momentum

As we move through 2024, the crypto market is seeing significant shifts like Cardano (ADA) crashing 89% from its peak, causing investors to look for faster-growing alternatives. On the contrary, Bitcoin (BTC) has made a remarkable comeback, with a price surge pushing it back over the \$60,000 mark and driving inflows into Bitcoin ETFs. Meanwhile, among the newbies, BlockDAG is rapidly gaining attention with its Testnet launch, becoming one of the most promising projects and challenging the crypto market leaders. Achieving this major milestone shows BlockDAG's technical strength and commitment. With its cutting-edge technology, strong presale, and potential for 20,000x returns, BlockDAG is positioning itself as the best crypto to buy in 2024. ADA Crashes: Investors Moving Away from Cardano? Cardano (ADA) has experienced a sharp downturn, with ADA crashing by 89% from its all-time high, now trading at \$0.33. Once hailed as an 'Ethereum killer,' Cardano's delayed development, including slow smart contract rollouts, has caused a significant drop in investor confidence. Recently, a major Cardano ICO investor completely offloaded their holdings, moving capital into faster-growing projects like Solana and the Ethereum-based token, REXS Finance (RXS). This shift highlights a trend where investors are seeking assets with quicker growth and practical use cases. While Cardano still holds a market cap of \$11.5 billion, the ADA crash and its inability to meet expectations have led stakeholders to explore alternatives with more immediate potential. BTC Price Surge Sparks \$187M Inflows to Bitcoin ETFs Bitcoin (BTC) has recently seen a significant price surge, reclaiming the crucial \$60,000 mark. This increase in value has led to a resurgence in inflows to Bitcoin ETFs, with a total of \$187 million being added. Fidelity's Wise Origin Bitcoin Fund (FBTC) led the pack with \$56.6 million in inflows, followed by Bitwise's Bitcoin ETF (BITB) with \$42.2 million. While many ETFs saw growth, BlackRock's iShares Bitcoin ETF, which had previously dominated the market, logged no inflows, leaving analysts puzzled. Despite this, BlackRock's IBIT continues to hold a massive \$21 billion in Bitcoin. Investors remain cautiously optimistic as they await the U.S. Federal Reserve's anticipated rate cut, which could influence Bitcoin's next move. BlockDAG Launches Testnet: Unstoppable Growth Ahead? BlockDAG is taking the crypto world by storm with the launch of its Testnet, a game-changing milestone that solidifies its place as a serious contender in the crypto world. BDAG holders with 7,500+ coins are now migrating from devnet to testnet. This move is a huge win for the community, giving them hands-on access to test the platform's cutting-edge features. BlockDAG's testnet isn't just a technical milestone; it's a clear message to the market that this project is built for success and ready for massive growth. But what's fueling this momentum? The answer is BlockDAG's advanced technology, well-executed roadmap, and a team that's firing on all cylinders. With features like smart contract support, real-time transaction tracking, and the ability to mint NFTs, the platform is setting new standards with its testnet. These factors have led analysts to predict a massive leap in BlockDAG's value, with projections suggesting the coin could reach \$20 by 2027, an astonishing 20,000x return for early holders. BlockDAG is also making history with the largest presale in crypto. The project has almost raised \$73.5 million, sold over 13 billion BDAG coins, and the price has skyrocketed 1680%, from \$0.001 to \$0.0178 in 22 presale batches. The demand is real, and as the presale continues to gather speed, the window of opportunity for new holders is closing fast. Where Is the Market Heading? As the crypto market evolves in 2024, different projects are taking very different paths. The ADA crash has left Cardano struggling, with its price falling to \$0.33 and investors seeking alternatives. At the same time, the BTC price surge has brought Bitcoin back above \$60,000, attracting steady interest but offering less explosive growth. In contrast, BlockDAG is making headlines for all the right reasons. With its Testnet launch showcasing its advanced technology, BlockDAG is seeing its presale soar, raising nearly \$73.5 million and pushing its coin price up to \$0.0178. Experts predict that early holders could see a massive 20,000x return in the future. For those seeking the best crypto to buy in 2024, BlockDAG's combination of innovation and growth potential makes it a compelling choice. Discover BlockDAG's website: <https://blockdag.network> - Presale: <https://purchase.blockdag.network> - Telegram: <https://t.me/blockdagnetworkofficial> - Discord: <https://discord.gg/Q7BxghMvYu> Disclaimer: TheNewsCrypto does not endorse any content on this page. - The US Spot Ethereum ETF saw a \$5.24 million inflow, primarily from BlackRock. - Ethereum's price of \$2,542.80 indicates strong market sentiment. Ethereum itself is witnessing a bullish trend, with large wallet transfers and increased trading volumes. As of September 19, the US Spot Ethereum ETF has shown significant movement, with a daily net inflow of \$5.24 million, primarily from BlackRock's ETHA, which recorded the entire inflow. The ETF now boasts total net assets of \$6.70 billion, and cumulative net inflows have reached \$610.35 million. However, most competing funds saw no inflows during this period. The bullish trend in the cryptocurrency market has prompted substantial transfers of Ethereum and Bitcoin. In just the past 20 hours, nearly 230,000 ETH were moved between various wallets. Notably, Galaxy Digital withdrew 3,500 ETH from Binance, bringing its total holdings to 65,368 ETH. Additionally, the Ethereum Foundation has also been active, selling 950 ETH valued at approximately \$2.27 million since the beginning of September. Ethereum Price Analysis: Currently, ETH is trading at \$2,542.80, reflecting a 4.53% increase in price. Market sentiment remains positive, with a total trading volume of \$19 billion, although this represents a 5.75% decrease. The overall market capitalization of ETH stands at \$306 billion, up 4.49%. From a technical perspective, the first support level is identified at \$2,436, while stronger support lies at \$2,253. The first resistance is currently set at \$2,561, with a secondary level at \$2,520. The Relative Strength Index (RSI) is at 62.62, indicating that Ethereum is in the overbought territory, suggesting a potential sell signal. The moving average data supports bullish momentum, with the 9-day MA at \$2,474 surpassing the 21-day MA at \$2,390. In summary, Ethereum is experiencing a dynamic phase marked by significant inflows into ETFs and heightened trading activity, indicating robust market interest amid cautious sentiment about potential overextension. - Crypto hackers have taken over the Supreme Court of India's YouTube channel to promote a Ripple scam. - Cybersecurity experts urge caution as scams targeting high-profile institutions become more prevalent. YouTube hackers have seized control of the Supreme Court of India's official YouTube channel to execute a Ripple and XRP scam. On September 20, the channel, which boasts over 217,000 subscribers, was rebranded to promote misleading cryptocurrency content. Users encountered videos touting Ripple and XRP investments, misleading many in the process. The fraudulent XRP livestream events frequently feature phishing links that prompt users to connect their crypto wallets. If a user clicks on these links and approves the request, hackers gain full access to the wallet. Indeed, allowing them to withdraw funds without any additional authentication. Following this, the channel is inaccessible as authorities scramble to address the breach. Also, the Supreme Court's administration has launched an investigation to determine the extent of the hack and how such a high-profile account was compromised. Also, this incident comes amid a wave of similar scams targeting well-known institutions, highlighting the need for greater attention. Moreover, cybersecurity experts are warning the public to exercise caution when engaging with cryptocurrency promotions, especially on social media platforms. Additionally, with the recent volatility in the cryptocurrency market, scams are becoming increasingly prevalent. The Supreme Court's case underscores the urgent need for enhanced security measures to protect official accounts from cyber threats. Highlighted Crypto News Today: CBOE Unveils \$150M Level as Digital Exchange Acquires SolanaFM

- Arthur Hayes deposits \$1.26M PENDLE, and retains \$5.93M unlocked tokens. - PENDLE hits 8-day high amid market recovery and whale activity. BitMEX co-founder Arthur Hayes made a significant move in the crypto market, depositing 350,010 tokens (\$1.26 million) to Binance and Bybit within the past hour. Hayes still holds 1.66 million PENDLE (\$5.93 million) in Pendle Finance, with these tokens now unlocked and available for sale. His estimated profit from it stands at \$1.09 million (+18.2%). Arthur Hayes (@CryptoHayes) sold 350K \$PENDLE (\$1.26M) at a loss in the past hour. "æ"

Lookonchain (@lookonchain) September 20, 2024 He bought 392,911 \$PENDLE (\$2.2M) at ~\$5.6 through #Wintermute from May 20 to June 21. 3 months later, \$PENDLE dropped by over 40%, prompting him to sell at a total loss of \$790K (-36%).
transaction from June 11, when a dormant whale transferred 755,000 PENDLE (\$3.83 million) to Binance. The whale still controls 4.27 million PENDLE (\$21.7 million), with a massive unrealized profit of \$22.8 million (+843%). Around the same time, Hayes had locked 1.65 million PENDLE (\$8.4 million) until September 5, with an unrealized profit of \$4.31 million (+113%). Meanwhile, PENDLE is currently trading at \$3.54, up 3.27% in the last 24 hours, despite a 7% dip in trading volume. The token has hit an 8-day high, benefitting from a broader market recovery, as total market capitalization has increased by 2.67%, while trading volume dropped by 6%. What is Ahead For PENDLE? PENDLE has emerged as one of the top-performing real-world asset (RWA) tokens. This comes as Donald Trump gears up to launch "World Liberty Financial" (WLFI), a decentralized finance (DeFi) protocol, on September 16. WLFI aims to digitize real estate, positioning itself in the RWA sector, and potentially challenging its momentum. Looking ahead, it faces resistance at \$3.86 and \$4.03. A bullish surge could propel its price higher, while a bearish reversal may push it down to \$3.10, with support at \$2.96. With a daily Relative Strength Index (RSI) of 61, the market is nearing overbought conditions, leaving traders on edge as they watch for further price action. Highlighted News Of The Day SOL Surpasses \$150 Level As Jupiter Exchange Acquires Solana

Crypto staking has grown to become one of the popular ways that crypto investors can earn passive income and contribute to the security of blockchain networks. The following article provides rankings for the Top 5 Crypto Staking Providers in 2024, placing OkayCoin as the leading platform among the most popular options in the modern world of Binance, Coinbase, Crypto.com, and Lido. - OkayCoin: Crypto Staking Leader OkayCoin tops the list in 2024, with a variety of its assets available for staking, good rewards, and the ease with which customers can stake their coins on their user-friendly interface. Investors who use OkayCoin can stake a number of different assets to obtain rewards efficiently and maximize their crypto holdings. Staking plans Available on OkayCoin Ethereum (ETH): A person can stake ETH on the Ethereum Proof of Stake upgrade and get consistent staking rewards. Polygon: OkayCoin offers high yields for staking MATIC, a token that helps secure the Polygon Layer 2 network, known for fast and low-cost transactions. Tron: Stake TRX and generate passive income while supporting a blockchain that boasts scalability and a suite of decentralized applications. Polkadot: By staking DOT on OkayCoin, users get strong rewards while supporting a network focused on enabling interoperability between blockchains. Celestia (TIA): By staking Celestia on OkayCoin, investors receive yields and contribute to one modular blockchain project focused on data availability. Aptos (APT): Aptos staking provides yields to its owners and contributes to a fast-growing blockchain that is scalable and safe. Sui (SUI): Staking SUI will help in securing a network that is focused on speed-of-light transaction execution and provide strong staking rewards. Avalanche (AVAX): Stake AVAX and earn rewards for being part of one of the most innovative platforms in the world, complete with subnets and high-speed transactions. Cardano (ADA): ADA staking on OkayCoin is well-suited for all those who want convenience in the staking process and at the same time are in pursuit of stable rewards accruing to them. Solana (SOL): High-yield staking of SOL is available at OkayCoin, contributing to the support of one of the fastest blockchains that allows using decentralized applications and crypto trading. Key Features of OkayCoin Competitive Staking Yields: OkayCoin regularly offers some of the highest staking yields in the market. Low Fees: With low fees, investors are able to maximize returns for their investments. Flexible Staking Terms: The platform gives users the opportunity to select flexible or fixed staking periods, which would, of course, depend on the investment strategy adopted. Liquid Staking: Investors are free to unlock their staked assets without waiting for the staking period, which guarantees flexibility. Referral Program Referral program provided by OkayCoin allows the users to invite more people to the platform and reward themselves with extra prizes. Here you will get the chance to earn at least 3.5% commission on every order. This is a fantastic opportunity to boost your earnings effortlessly. How to sign up Registration: Go onto the website and sign up yourself by putting your e-mail address. Verify it through their Know Your Customer policy. At the time you sign up. You will get a welcome bonus of \$100. Deposit Funds: Deposit your desired cryptocurrency or buy it directly from the website of the OkayCoin. Start Staking: Enter the staking pool and select the asset to stake, such as ETH, MATIC, or AVAX. Rewards are credited in kind. - Binance: A Fully Fledged Ecosystem for Staking Binance is a crypto exchange and one of the most versatile staking platforms out there. It offers a wide range of staking options for various assets giving investors the ability to further diversify their staking portfolio. Key Features Flexible and Locked Staking: Investors can choose between flexible staking, which allows for easy withdrawal, or locked staking, which offers higher rewards. High Liquidity: Binance houses one of the largest user bases, and this exchange has very high liquidity and is easy to stake. While Binance Staking is competitive, its yield cannot be considered greater than that of OkayCoin with respect to user experience and fee schedule. - Coinbase: Easy-to-Use Staking Platform Coinbase provides users with the easiest staking experience that will be perfect for new investors in crypto staking. While Coinbase doesn't offer as many staking assets as Binance or OkayCoin, it focuses on main-market coins such as Ethereum, Tezos, and Algorand. Key Features User-Friendly Interface: Coinbase was designed to be simple, and its interface is really friendly and approachable even for the most inexperienced user. High Security: Being a regulated exchange, Coinbase puts great emphasis on security and keeps all the staked assets really well protected. Learning and Earn: Through the educational programs of Coinbase, one earns passively while learning much about crypto staking and blockchain technology. That's the beauty of Coinbase: foolproof, simple and less variety than OkayCoin and others for staking options. - Crypto.com: Reward for CRO Holders Crypto.com provides a versatile staking platform, and it has very unique rewards for the staking of its native token, CRO. It offers higher cashback on the Crypto.com Visa Card, with much higher interest rates. Key Features Multi-Asset Staking: Crypto.com allows staking of multiple top assets such as Ethereum, Polkadot, and Cardano. CRO Benefits: Staking CRO gives users access to more attractive rewards, including better interest rates and cardholder benefits. Flexible Terms: Crypto.com offers flexible and fixed-term staking, thus giving options to the users according to their preference. Still, Crypto.com extends good returns to the holders of the CRO token; as far as staking, in general, is concerned, and yields are higher, OkayCoin remains a good bet. - Lido: Liquid Staking for Maximum Flexibility Lido is a decentralized staking platform focused on liquid staking, enabling users to get rewards within the process without freezing their funds. That is why Lido can be considered a very good choice for users who want to keep liquidity open when participating in staking. Key Features Liquid Staking: This allows some users to stake their assets while still using them in other DeFi activities; they receive staked tokens, such as stETH for Ethereum. Ethereum 2.0 Staking: Lido is primarily an Ethereum staking solution, and hence, it is the go-to platform when it comes to ETH staking. Decentralized Governance: Lido is community governed, and staking holders can vote on significant decisions pertaining to the platform. Conclusion It has indeed become one of the most important tools for crypto investors seeking passive income and wanting to take part in securing blockchain networks. In 2024, OkayCoin leads the market in the variety of staking assets, competitive reward rates, and most importantly-smooth staking experiences. Other platforms-like Binance, Coinbase, Crypto.com, and Lido-offer their unique sets of advantages, so really, there is a staking provider for every kind of crypto investor out there. The world of crypto is like a rollercoaster with no brakes. This is evident from the massive new moves of Internet Computer (ICP) and Tron Network, while BlockDAG sneaks up from behind, ready to steal the show. ICP is busy figuring out its next move for a bullish future and Tron Network is cutting costs and increasing transactions. But BlockDAG is doing what all the cool kids do—capturing attention with its innovative mining tech that can make users crypto millionaires, building a community, and showing potential for 20,000x ROI. Let's dive into the latest from these three projects and see which one has the best shot at making crypto millionaires. Internet Computer Price Prediction: Trying to Find Its Groove Internet Computer (ICP) has had a rough few months, trading around \$7.50 in early September—quite the fall from its all-time high of \$700.65. Ouch. Some analysts say ICP might be stuck in the mud for a while, struggling to break past current resistance levels. If things don't turn around, the price could dip further to \$5.80. But here's the thing: ICP has always been a bit of a gamble. It's like betting on a good old Bitcoin rally, but with a much higher risk. If you're looking for a reward up to 10,000x, ICP might be your ticket. But if you're looking for a steady, reliable return, you might want to look elsewhere. The Bottom Line: ICP is a high-risk, high-reward play. It's not for the faint of heart. Tron Network News: Cutting Costs Like a Pro Tron Network: Cutting Costs Like a Pro Tron Network, under the watchful eye of Justin Sun, is gearing up for a makeover that's all about efficiency. The plan? A 25% boost in the network's energy cap from 120 billion to 150 billion per day and a 50% reduction in energy costs. In non-geek speak, this means cheaper fees and more transactions. And that's a win-win for everyone! These updates could turbocharge the Tron ecosystem, potentially doubling daily transactions. Tron could soon match Solana's 20 million daily transactions—like a tortoise finally catching up to the hare. With lower costs and higher efficiency, Tron's looking to pull in more users and stake its claim in the long-term growth game. BlockDAG: The Dark Horse That's Creating the Buzz While ICP is soul-searching and Tron is trimming the fat, BlockDAG is turning heads with some serious game-changing moves. During a recent Ask Me Anything (AMA) session, BlockDAG's CEO Antony Turner dropped a bombshell: pairing the X10 miner with the X1 miner boosts performance by a whopping 10 times! No wonder the miner community is fired up as BlockDAG's got them dreaming of massive gains, and the community is now 120,000 strong and counting. That's not all. BlockDAG is rolling out updates to its X1 Miner app across Apple, Huawei, Amazon, and Android. Expect new features like dynamic FAQs and better security to keep those spammy rewards in check. Plus, the app has already mined over 20 million BDAG coins—worth around \$1 million at launch. Talk about mining success! And the excitement keeps building, especially with BlockDAG's mining capabilities and 20,000x ROI projections. With a stellar presale performance raising \$73 million and selling 13 billion coins, BlockDAG is quickly moving from crypto newbie to serious contender. The rising interest from both miners and everyday users shows that BlockDAG isn't just a flash in the pan—it could be setting the stage for a blockbuster debut in the crypto market. Become a Crypto Millionaire Internet Computer and Tron Network might be making their moves, but BlockDAG is the one that's got everyone talking. With fresh updates, a booming community, and a knack for making miners smile, BlockDAG seems to have cracked the code for success. Whether it's the tenfold boost from its X10-X1 miner combo or its viral app updates, BlockDAG is pulling out all the stops. So while ICP and Tron are doing their best to keep up, BlockDAG is racing ahead, proving that sometimes, the underdog has the best tricks up its sleeve. Keep an eye on BlockDAG—this platform might just be the next big thing in the world of crypto millionaires. - Commerzbank offers crypto trading services via Crypto Finance. The service will start with Bitcoin and Ethereum, aimed at specific corporate clients of Commerzbank in Germany. Commerzbank, Germany's second-largest bank by branches, has partnered with Crypto Finance, a subsidiary of Germany's largest stock exchange operator, to provide crypto trading services for its corporate clients. According to the announcement, this move will initially focus on Bitcoin (BTC) and Ethereum (ETH), allowing businesses to easily and securely engage with these digital assets. Commerzbank, one of Germany's leading financial institutions, has been steadily advancing its involvement in digital assets. This partnership is seen as a major step, as it signals Commerzbank's commitment to offering its clients secure access to the growing cryptocurrency market. With this new service, corporate clients will have the ability to trade various digital assets, further integrating crypto into the mainstream financial ecosystem. Strategic Moves to Enhance Crypto Services in Europe This partnership follows a series of strategic moves by Crypto Finance. Recently, the firm expanded its offerings by integrating crypto custody solutions and securing regulatory approval from Swiss authorities. As part of Deutsche Börse, Crypto Finance is leading institutional crypto adoption in Europe. Additionally, it has signed a similar agreement with Zürcher Kantonalbank (ZKB) in Switzerland. Further, this news comes after DZ Bank announced plans to test retail crypto trading in February. Commerzbank has been increasing its involvement in the digital asset space since obtaining a crypto custody license in November 2023. This license allows the bank to offer expanded services in digital asset management for corporate clients. Highlighted crypto News Today Solana (SOL) Price Surges Amid Exciting Smartphone Announcement

While the crypto space keeps on evolving day in and day out, staking has emerged as one of the more popular ways for investors to earn passive income from their digital assets. In 2024, a wide array of crypto staking platforms are available for staking, but not all are created equal. If you are searching for the highest-paying staking platforms this year, you have come to the right place. STAKING AI certainly leads among the best, with a wide array of benefits that are not easily matched. Our list of the top 9 most rewarding crypto staking platforms in 2024 includes: 1.

STAKING AI 2. Kraken 3. Binance 4. Coinbase 5. Gemini 6. KuCoin 7. eToro 8. OKX 9. Bybit 1. STAKING AI STAKING AI takes the pole position and leads among the most profitable and reliable staking platforms of 2024. This platform is way more than just another staking service provider, itâ€™s an infrastructure operator for Proof-of-Stake public blockchains. It offers everything a crypto enthusiast needs to maximize his/her staking rewards. Why Choose STAKING AI? A free \$100 staking bonus upon signing up gives you an instant head start in your crypto staking journey. Referral commissions are earned by inviting others to the platform. You will be earning a 4% commission based on the staking activities of your referral. You will be seeing your rewards grow in real-time, and remember you will continue to earn this commission as long as your referrals continue staking on STAKING AI as the program does not cap the amount you can earn. For example, if you stakes \$200 for 1 day in Trx Staking Pool, you will earn \$2.20 daily plus a \$1.6 referral reward, but if you stake \$300,000 for 45 days in Ethereum Staking Pool Plus, you earn \$10,500 daily rewards and a \$15,000 referral rewards if your referral stake the same amount. Liquid staking options will provide flexibility in terms of access to staked assets without necessarily locking them up for long time. A professional team is distributed globally to ensure 24/7 management of the validator nodes and a seamless staking experience. Security is the number one priority, with regulated infrastructure and non-custodial delegation services making sure your assets are safe. The STAKING AI is a very user-friendly platform that dives into the world of staking for any user. One needs to sign up, choose a staking plan, and start earning the rewards right there. Start now and watch your money multiply daily. 2. Kraken Kraken is an internationally recognized platform promising excellent staking for leading cryptocurrencies like Ethereum, Polkadot, and Solana. The staking rewards provided by Kraken are competitive in nature, and the process involved in staking is quite easy with no minimum staking requirement. Kraken allows the staking of more than a dozen cryptocurrencies, with yields ranging from 4% to 20% annually, which in no way compares to that of STAKING AI. 3. Binance Well, Binance is a giant in the crypto world, and this staking service from it is no exception. The flexible staking options on the platform are available with the huge variety of PoS assets being staked. Depending on the asset, Binanceâ€™s APYs can be as high as 30%. However, Binance doesnâ€™t provide special perks like STAKING AI referral commissions and free bonuses. 4. Coinbase Coinbase provides a very user-friendly interface for staking, especially for complete beginners. It supports a small but solid range of coins, such as Ethereum, Tezos, and Cosmos. It offers competitive returns at higher fees compared to other staking services, including STAKING AI. 5. Gemini Gemini Earn staking service permits the staking of crypto holdings to generate interest. While it is a good return on assets like Ethereum and Filecoin, it is conservatively directed at investment. STAKING AI outperforms Gemini in having more variations in staking pools and higher daily returns. 6. KuCoin Another popular exchange where staking services are offered is KuCoin through its KuCoin Earn service. This platform lists several PoS coins for staking, including Polkadot and Kusama, with APYs starting from 5% to 12%. KuCoin also offers flexible staking plans. However, its rewards are not that competitive in profitability and convenience, considering the peculiar affiliate program that STAKING AI offers. 7. eToro eToro is a well-liked online trading platform that provides support for staking several cryptocurrencies, including Ethereum and Cardano. eToro provides good staking rewards, but since the main focus is on trading and investing, there may not be as many options for staking. If youâ€™re seeking a more rewarding staking experience specifically as a means to increase your return, then STAKING AI will be much more precise. 8. OKX OKX offers over 30 cryptocurrencies for staking with competitive APYs and flexible staking terms. OKX doesnâ€™t really have rewarding referral rewards or account staking bonuses that compare to STAKING AI. If you want to earn passive income through staking, then go for STAKING AI. 9. Bybit Bybit supports high-yield staking, especially for Ethereum and the wider top cryptocurrencies. It is highly user-friendly, with easy access to navigation. The staking platform they offer allows the user to explore pools that are flexible in terms of duration. However, it lacks the comprehensive infrastructure, security and diverse staking plans that STAKING AI provides. Conclusion: STAKING AI Reigns Supreme STAKING AI is the most profitable staking in 2024. The fact that this investing and staking platform has the most reliable infrastructure, flexible staking plans, high daily rewards, and a fantastic referral program makes it second to none for both new and experienced investors. Of course, other leading platforms like Kraken, Binance, and Coinbase have decent staking, but no single one comes anywhere close to the overall set of rewards or ease of use that STAKING AI offers. Get started today with STAKING AI for a secure, profitable, and stress-free staking experience. Disclaimer: TheNewsCrypto does not endorse any content on this page. io.net, a decentralized distributed compute network designed to enable machine learning at scale, has formed a strategic partnership with TARS Protocol, one of the only AI-driven, scalable Web3 infrastructure platforms native to Solana and backed by the Solana Foundation. The two firms have decided to work together to find ways to integrate their respective platforms and launch cooperative projects to hasten the spread of decentralized artificial intelligence (AI) and Blockchain-as-a-Service (BaaS) solutions. Together, io.net and TARS Protocol are developing innovative services and solutions for the AI and Web3 ecosystems. By working together, the two firms want to quickly help developers and organizations make the shift from Web2 to Web3 by combining blockchain technology and artificial intelligence. In order to facilitate the efficient and rapid deployment of AI models, io.net will bring its network of more than 11,000 distributed devices (Gpus + Cpus: <https://id.io.net/explorer/home>) to the TARS AI Hub. The integration between TARS and io.netâ€™s decentralized GPU clusters will allow customers to train AI models for up to 30% less money, all while getting the speed and scalability required for advanced AI applications. As the firm pushes the limits of decentralized AI, this alliance creates new technology, ecosystems, and strategic prospects for ecosystem developers to bet on. io.net and TARS Protocol want to further innovation for the benefit of the 1,000+ developers and companies on both platforms. To that end, they have developed a combined roadmap that includes important co-marketing initiatives over the next six months. Users will benefit from more decentralized infrastructure, faster AI implementations, lower costs, and more flexibility.

Bitcoinâ€™s price surge to \$60,654 reflects a 4.30% daily increase, nearing key resistance levels. Whale transfers and a \$186.76 million inflow into the U.S. Spot Bitcoin ETF highlight institutional interest. Bitcoin is currently experiencing significant upward momentum, trading at \$60,654, reflecting a 4.30% increase over the past day. This price is nearing a key resistance level at \$61,401, which was noted on September 17. Whale activity is also noteworthy, with significant transfers occurring. A dormant whale transferred 1,215 BTC from an unknown wallet to Antpool, followed by a transfer of 2,753 BTC back to an unknown wallet. Meanwhile, the U.S. Spot Bitcoin ETF has attracted a net inflow of \$186.76 million, with total assets reaching \$54.84 billion, highlighting increasing institutional interest. As Bitcoin approaches its all-time high of \$61,316 set six months ago, market participants are closely watching for breakout opportunities. In terms of trading activity, the 24-hour volume has surged to \$39 billion, reflecting a 37.55% increase. Additionally, NFT sales on the Bitcoin network have seen a notable rise, totaling \$891,034 with 840 transactions recorded in the past 24 hours. Bitcoin Price Analysis: Support levels are currently \$57,435, with moving averages indicating a short-term trend. The 9-day and 21-day moving averages are at 59,608 and 59,435, respectively. Meanwhile, the overall moving average sits at 59,633, which is just below the current trading price. This alignment may suggest potential volatility as traders assess their positions. The Relative Strength Index (RSI) stands at 59.83, indicating a neutral state with a slight bias toward bullish sentiment, although itâ€™s approaching the overbought territory. The moving average of the 15 is slightly lower at 59.99, suggesting the momentum might be stabilizing. Market sentiment remains cautiously bearish, with only 44% of participants expressing bullish views against 56% identifying as bearish. The Fear and Greed Index registers at 38, indicating a state of fear among investors. Despite this, Bitcoin maintains a robust market cap of \$1.20 trillion, showing a 4.37% increase, solidifying its position as the leading cryptocurrency. Highlighted Crypto News today: Coinbase Denies Claims of Issuing Bitcoin IOUs to BlackRock

- Charles Hoskinson claims Leios upgrade will make Cardano faster than Solana. - ADA price drops 1% despite upgrade news, with declining trading volume. Technical analysis suggests potential 12% drop to \$0.27 if \$0.31 support breaks. Cardano founder Charles Hoskinson has stirred the cryptocurrency community with a bold assertion regarding the networkâ€™s forthcoming Leios upgrade. Hoskinson contends that this enhancement will catapult Cardanoâ€™s transaction speed beyond that of its rival, Solana. However, despite the founderâ€™s optimistic outlook, ADAâ€™s market performance has remained subdued, with the token experiencing a price decline and a drop in trading volume over the past 24 hours. The Ouroboros Leios upgrade represents Cardanoâ€™s most significant technological advancement since the Chang hard fork implementation in early September. Developers promise tiered transaction fees and accelerated chain synchronization, features that Hoskinson believes will position Cardano as a frontrunner in the competitive â€œEthereum killerâ€ landscape. Cardanoâ€™s price action has been lackluster. Despite the founderâ€™s bullish rhetoric, Cardanoâ€™s price action has been lackluster. Trading at \$0.34, ADA has failed to garner major buying interest, with its trading volume contracting by 10% over the last day. This muted response suggests a disconnect between technological advancements and immediate market sentiment. On-chain metrics further corroborate this tepid demand for ADA. The daily price daily active addresses (DAAs) divergence, a key indicator measuring price movements against changes in daily active addresses, has consistently posted negative values since September 8. This trend highlights a nine-day downward trajectory in buying activity, despite the buzz surrounding the Leios upgrade. Sentiment analysis paints an equally bearish picture, with ADAâ€™s weighted sentiment registering -0.20 at press time. This negative reading indicates a prevalence of fear, uncertainty, and doubt in social media discussions, often a harbinger of sustained price downtrends. From a technical perspective, Cardanoâ€™s price chart reveals a descending triangle pattern formation since July 15, typically considered a bearish indicator. With ADAâ€™s price hovering precariously close to the critical \$0.31 support level, the potential for a significant downside move looms large. A breach of this support could trigger a 12% decline, potentially driving ADA to its August 5 low of \$0.27.

In the fast-paced industry that is cryptocurrency, it is a constant search for the horizon for traders and investors alike. One expert in trading cryptocurrencies outdid himself attaining 100x ROI on some of the tokens in the market that were very profitable in 2021, which was then, very profitable indeed. Now, the same trader is putting all his reputation on the line for an entirely new project, that he believes will reach 8000% in the future â€” itâ€™s a real estate tokenization altcoin that is currently priced under \$0.10 which is Rexas Finance (RXS). As the adoption of blockchain technology continues to redefine the projection of several businesses, the real estate tokenization trend spearheaded by Rexas Finance is set to change the way physical asset investment is done, making it easier and more profitable than ever. What is Rexas Finance (RXS)? Rexas Finance is an upcoming blockchain firm, which primarily targets the tokenization of Real World Assets (RWA), specifically real estate, commodities, art, and other high-worth physical assets. The tokenization of real-world assets refers to the process of creating digital tokens that represent commercial stakes in tangible assets and that can be traded through a blockchain-based platform. This enables investors from every corner of the globe to be able to purchase a part of the entire portion of an asset that was only within the reach of large institutions or very rich people. The size of the real estate business alone exceeds \$379 trillion in value and, unsurprisingly, it takes the lead as the richest asset class in the world today. This is where they come in â€” Rexas Finance makes it possible for both big and small investors to participate in this enormous industry by adopting real estate tokens and therefore selling the underlying assets. Be it million-dollar real estate assets in New York Times Square or stake-hold in real estate properties in Hong Kong, Rexas Finance is paving the way for the common man to invest in places where only the wealthy would in the recent past. Why Real Estate Tokenization is a Game Changer The real estate industry has long been dominated by traditional structures that limit access to only the wealthiest investors. High capital requirements, legal complexities, and geographical barriers have catered the investment in the real estate domain to a select few only. The good thing, however, is that Rexas Finance offers a solution to these challenges by embracing the use of blockchain technology, fractional sales, and international purchasing. The ability to invest in properties anywhere on the planet has for decades eluded many because of the high costs associated with it. While making money is everyoneâ€™s motivation, Rexas Finance makes it easy to own a piece of property according to the available colonies. For instance, an individual based in Asia can have ownership of a part of a commercial building in Europe or a luxury home in New York making passive income out of those investments without the hassle of normal real estate ownership. Most importantly, buyers and sellers will see the benefits of Rexas Finance, which helps create liquidity in the notoriously illiquid property market. That is, one can now digitize portions of real estate through the blockchain and transact with ease, a level of convenience that has never been in the property market. This increase in liquidity means that real estate is not only more attractive to larger institutions but also to smaller investors eager to invest to spread their risk management. Key Features of Rexas Finance (RXS) - Rexas Token Builder One of the most innovative features of Rexas Finance is its Token Builder, which enables the user to respect and secure the assets within the virtual space. To add, everyone from an entrepreneur to a real estate owner and an artist can in this easy manner â€” bring their assets

on the blockchain™ even without coding. The Token Builder allows the creation of digital tokens linked to real-world assets, which are further tradable on decentralized exchanges. This tool is especially useful to businesses and real estate developers trying to tap into capital markets by offering fractional ownership of their assets. There is no specific constituency targeted, which is expensive, the Rexas Token Builder takes care of that and it does affect other investors, thus everyone can tokenize and sell their assets in a global market. - Rexas Launchpad The Rexas Launchpad is a platform where business people and real estate developers can seek investment by giving up tokenized assets. Whether it is a building project to be developed or a new collection of artworks the launchpad platform enables the creators and investors to engage and explore the market. Rexas Estate this module of the Rexas Estate feature addresses real estate tokenization as of the sale of fractional ownership in properties around the globe. Real estate investors can purchase, sell, or trade portions of properties on the blockchain, therefore making real estate investment less rigid and easier to participate in. This allows real estate investors to invest in real estate that has for ages been regarded as one of the safest and highly yielding assets. The Total Addressable Market: Unlimited Potential Rexas Finance has chosen some of the biggest target markets, including real estate, commodities, and fine art. Then, the total addressable market (TAM) for this company is almost unlimited, considering it covers industries worth multi-trillion dollars and has not been improved. Rexas is turning previously non-existent or illiquid possibilities into new assets for both the investors and the asset owners, and the upside here is massive. As of writing, Rexas Finance is presently running its second presale stage where 1 RXS is going for \$0.040 highly up from the first presale stage by 33.33 %. Then at the next stage, the price is supposed to be \$0.050 and that will be a significant increase with 40.99% of the token already sold. Investors are expected to recognize the potential of this project and those who get in early are poised for significant gains. Industry experts predict that the RXS token could see an 8,500% increase in value, offering early investors a chance to achieve life-changing returns. Why Rexas Finance Could Skyrocket 8,500% The expert trader who had 100x ROI in the year 2021 believes Rexas Finance can achieve the same goal. With an emphasis on the tokenization of real-life assets, Rexas is addressing multi-trillion-dollar verticals with a huge growth potential. Besides, it has managed to generate robust presale interest with more than \$575,000 raised and 18,132,079 tokens sold in under 3 days. Rexas Finance stands apart from many speculative altcoins in that it has practical applications that are beneficial to both the investors and the asset owners. By developing the tokenization of real estate, gold, or other assets, the RXS still presents a very attractive business model making it one of the best altcoins in the current cryptocurrency market. Conclusion: Don't Miss the Next 8,500% Opportunity Anyone eager to put their money into a project that holds purpose and has enormous potential for expansion should have no second thoughts about Rexas Finance (RXS). Targeting the areas of the tokenization of real-world assets, tapping into multi-trillion-dollar industries, and the support of a skilled investor who had made a 100x investment ROI turn Rexas Finance into a profitable entity. All the early investors who participate in the presale currently can expect returns of 6 times their funds as the project is likely to continue drawing more support. Rexas Finance is not just yet another altcoin as it is the very advancement in the sphere of real estate, commodities, and asset tokenization. Hurry up & grab Rexas Finance coins now, and get ready to seize the new crypto revolution! Disclaimer: TheNewsCrypto does not endorse any content on this page. - Despite full unlocking, only 25.83% of UNI tokens are actively circulating in the market. - UNI is trading at \$6.47 by 1.94% increase, with a market cap of \$3 billion. The native token of Uniswap™ UNI was issued and listed in September 2020. The team, investors, advisors, and community treasury received a total of 83% of the allocation, amounting to 8.3 billion tokens. These tokens are subject to a four-year unlocking period. UNI was fully unlocked four years ago, but the actual circulation tells a different story. Initially, 83% of the 1 billion tokens, totaling 830 million, were allocated to the team, investors, advisors, and the community treasury, with a four-year unlocking cycle. Despite this, only 25.83% of the total UNI, or approximately 258.3 million tokens, is currently in circulation. At launch, 17% of the token was distributed through LP mining and airdrops, which have all been circulated. Therefore, the focus shifts to the community treasury and the investors. Furthermore, the community treasury was allocated 430 million UNI, all of which have been unlocked. Currently, the treasury holds 399,789,850 UNI, meaning only 30,210,150 has entered the market over the past four years. In addition, among the 400 million UNI allocated to the community treasury, 58,164,177 have flowed into the market. Notably, top addresses, which received significant allocations, have sold very little, contributing to the low sales ratio. The General Market Analysis of UNI According to CoinMarketCap, Uniswap (UNI) is priced at \$6.47, having a 1.94% increase in the past 24 hours. TradingView data shows an RSI of 52.43, with the 9-day moving average at 52.99, indicating a neutral zone. The 9-day moving average is currently above the 21-day moving average. The token's trading volume is \$83 million, representing a 24.94% change, with a market cap of \$3 billion. While UNI is fully unlocked, with a 100% circulation rate, the actual market circulation remains around 258.3 million tokens (25.83% of the total), as most unlocked tokens from the community treasury remain unsold. Highlighted Crypto News Today: Bitcoin Bear Run Extends as Price Holds on Stubbornly at \$58K

Singapore, September 16th, 2024 Chainwire - Built on Base, Unite is launching its inaugural earning season - Users can earn \$UNITE tokens in Momae's Kitchen, the first profitable casual mobile game in web3 - Minting Soul Bound Token (SBT) in-game Asset Offers an Exclusive Bonus Multiplier for Airdrop Unite, a groundbreaking Layer 3 blockchain solution built on Base and backed by industry leaders like Coinbase Ventures, OKX Ventures, Solana Ventures, and Superlayer, is excited to launch its inaugural in-game season for the popular casual mobile game, Momae's Kitchen: Cooking Games. Since its June launch, Unite has quickly established itself as a key player in web3 mobile gaming infrastructure; achieving over 5 million downloads across its suite of games on iOS and Android. Unite's mission is to bring the mobile gaming industry's massive \$90 billion revenue and its 2.8 billion players into the world of web3, setting a new standard for blockchain-based gaming experiences. Introducing The \$UNITE Airdrop Bonus Multiplier in Momae's Kitchen Momae's Kitchen: Cooking Games, published by Unite, attracted over 500,000 downloads across more than 200 countries, with strong user bases in the United States, India, Indonesia, and the United Kingdom. Through revenue earned from in-game advertising and item purchases, Momae's Kitchen is one of the first profitable casual mobile games in web3. Momae's Kitchen is available for download on the Apple's App Store and Google Play Store. With over 320,000 total unique active wallets, Momae's Kitchen has established itself as a leading mobile game for players looking to earn while playing and exploring the potential of blockchain technology. Momae's Kitchen has created a unique gaming experience where players can earn rewards by watching ads, playing the game, and participating in various in-game activities. As part of this initiative, Unite is introducing a limited-time \$UNITE Airdrop Bonus Multiplier that offers players an opportunity to significantly increase their token rewards by participating in the game. The total prize pool for the inaugural season is 565 million \$UNITE, which is approximately 1.86% of the token's total supply. Players can mint a unique, soul-bound token (SBT) in-game assets called Platinum Piggy that guarantees a higher allocation of \$UNITE tokens from Unite's community reward campaign, Unite Odyssey. This achievement reflects Unite's commitment to maximizing the earning potential of its players. As the \$UNITE Token Generation Event (TGE) draws near, Unite is offering its community members the chance to enhance their airdrop allocations by actively participating in the game and acquiring the Platinum Piggy in-game asset. This soul-bound token unlocks the potential for earnings by playing the game, viewing ads, and making in-game purchases. Each action taken after acquiring the Platinum Piggy SBT contributes to earning exclusive Unite points, which can be converted into \$UNITE tokens before the TGE. Recently, Unite has raised \$3 million from its seed extension round demonstrating a significant level of belief in Unite's vision to be the first and best L3 chain for mass-market mobile games. Joining the Unite Community and Boosting \$UNITE Airdrop Unite is thrilled by the community's enthusiasm throughout the Odyssey campaign and is committed to ensuring a fair \$UNITE token distribution for its mobile game players. This exclusive token airdrop bonus multiplier is designed to reward active participants and demonstrate Unite's appreciation for its loyal community. Users can stay tuned for additional details on the Momae's Kitchen \$UNITE Airdrop Bonus Multiplier. Unite is also opening up collaboration opportunities with leading web3 communities to secure whitelist spots. Interested communities can reach out to them via DM on X @uniteio for consideration. About Momae's Kitchen Momae's Kitchen: Cooking Games is a free-to-play casual mobile game offering a unique blend of fun and earning potential in the web3 space. Players will enjoy a smooth gameplay experience in this online cooking simulator, serving foodies with a variety of unique recipes across hundreds of challenging levels. Players who generate value from this game will receive rewards in the form of crypto or gift cards for brands like Amazon, Adidas, Starbucks, and more. Through in-game advertising and item purchases, Momae's Kitchen has become one of the first profitable web3 mobile games. Users can download Momae's Kitchen on App Store (iOS) or Google Play (Android). About Unite Unite is on a mission to build the first Layer 3 blockchain solution for mass-market mobile games, targeting the 2.8 billion players and the \$90 billion revenue generated from the mobile game market. Focused on enhancing player experience with in-game earning capabilities, Unite offers a comprehensive L3 solution encompassing chain, client, ecosystem and establishing a decentralized physical infrastructure (DePin) built on billions of daily active mobile devices worldwide. Founded by veterans in mobile, gaming and web3 infrastructure who served as founders and executives of some of the biggest names, Unite is leading the innovation to the mobile games. For more information, users can visit Unite's official website, follow them on X, and join the Unite Discord community. Contact Head of Growth Di Chen Uniteio dchen@unite.io

- Bitcoin price recorded a 2.38% decline in daily price movement as per CMC data. - The cryptocurrency's daily trading volume surged by 67.96% in the last 24 hours. The overall crypto market entered a slump over the weekend, after prices fell yet another time this month. Amid increased volatility, prices have been struggling to sustain bullish movements in the past few months. This has resulted in fluctuating market sentiments and an uncertainty among investors. Notably, leading cryptocurrency, Bitcoin exhibited a 2.38% price drop over the last 24 hours and slid down to its previous resistance at \$58K. This led to a price drop in other cryptocurrencies within the altcoin sector. In particular, Ethereum incurred a 5.21% drop while Solana dipped 4.34%. On inferring the cryptocurrency's daily price chart, the downward movement began in the Asian late evening hours of September 15. In the following day, Bitcoin hit an intraday low of \$58,143. After which it showed mild upward movements and reached current trading levels. At the time of writing, Bitcoin was trading at \$58,776 as per CMC data. Moreover, on September 14, BTC price retraced back to its \$60K level momentarily. This led the crypto community to expect a bull run, until however prices failed to sustain the positive momentum. Meanwhile, as aforementioned, Bitcoin fell further in the past day. Additionally, according to CoinGlass data, Bitcoin recorded \$31.48 million in 24-hour liquidations. The token's recent price drop has facilitated selling pressure, leading to the struggles to maintain a neutral sentiment among investors. How was Bitcoin's Performance Over the Last Week? Bitcoin, in the past 7 days, showed intriguing price movements, with a performance of 6.58% increase. At the beginning of the week, BTC traded at a low of \$54,645. As the days progressed the digital asset sparked bullish candles and climbed to a weekly high of \$60,615 on September 13. Additionally, the token's short-term 9-day MA stands below the 21-day MA indicating the overall bearish trend as per TradingView reports. However, Bitcoin's RSI fell to 50.29, influenced by the recent dip as investors show selling movements. However, in the past two days, the token has receded to its previous level at \$58,000. If Bitcoin manages to overpower the current bearish turn it might face resistance at \$60,551 and \$61,285. Highlighted Crypto News Today: Circle and Sony Enable USDC on Soneium Blockchain for Creators

- According to DappRadar statistics, NFT market sales for the last week came to \$74.86M. - With sales of \$5.39 million, an increase of 9.45%, Cryptopunks topped the charts. Another decline in NFT market sales occurred during the last week, with a decline of 7.91% from the prior week. Both the number of buyers and sellers saw significant drops; the former fell by 73.46 percent and the latter by 61.18 percent from the previous week. According to DappRadar statistics, NFT market sales for the last week came to \$74.86 million, which is a decrease of 7.91% from the previous week. Although sales of NFTs based on Ethereum fell by 9.73%, Ethereum still topped blockchain sales volume with \$27.25 million. With \$14.89 million, a 31.01% rise, Bitcoin claimed the second place, while Solana finished in third with \$12.47 million, a 12.31% reduction. Top Collections Dominate With sales of \$5.39 million, an increase of 9.45%, Cryptopunks topped the charts this week. Next were Bitcoin BRC20 NFTs, which had an even more astounding 475% rise, reaching \$3.45 million with a 9.28% increase in sales, a 4.4% rise in immutable X's Guild of Guardians (GoG) took the 22nd place. Solana's Boogle #025 went for \$143,070, and five days ago, BNB's Paraluni Perpetual Bond fetched \$129,337. Premium collections are staying ahead of the curve in a dynamic market, even while sales and activity are down. Among the NFT market's major sales swings during the previous week, CryptoPunks stands head and shoulders above the competition. With a little gain of 0.15% from the previous week, the famous pixelated collection now owned by Yuga Labs generated \$5 million in sales. Highlighted Crypto News Today: What Is the Future of Central Bank Digital

- Bitcoin price recorded a 3.65% increase in the last 24 hours as per CMC data. - The cryptocurrency's daily trading volume increased by 8.20%. The crypto community rejoiced at a full-fledged price recovery in the last 24 hours. After a prolonged price slump over the past few weeks, leading cryptocurrencies retraced to their previous trading levels. Bitcoin returned to the spotlight as prices reached \$60K in the Asian early morning hours of September 14. Meanwhile, the altcoin sector, despite the upward movements, is yet to break key resistance levels. Ethereum, at the time of writing, is attempting to break resistance at the \$2.5K while Solana is closing in on \$140. Apart from this, the memecoin sector has shown significant positive price movements. On inferring Bitcoin's daily price chart, the cryptocurrency began its upward price movement towards the Asian evening hours of September 13. Notably, prices rose from an intra-day low of \$57,650. Following this, BTC climbed all the way to a 15-day high of \$60,615. At the time of writing, the \$60,154 after a 3.65% increase according to CMC data. Additionally, the digital asset's daily trading volume showed a modest increase of 5.17%. Moreover, as per Sosovalde reports, US spot BTC ETFs witnessed significant inflows of \$263.07 million on September 13. Will Bitcoin Witness a Price Breakout Amid Buy Signals? According to TradingView data, Bitcoin's current short-term 9-day MA stands below the long-term 21-day MA. This is a result of BTC's prolonged price slump at \$56K and \$58K levels. However, the past day's upward trend is reflected in the cryptocurrency's RSI standing at 54.88 indicating neutral market sentiments and buy signals. Meanwhile, when using the Moving Average Convergence and Divergence (MACD) technical indicator, the short-term signal line stands above the long-term MACD line. This suggests the token's bullish turn over the past day. Finally, market analysts have predicted that BTC might witness a price breakout after this recent recovery. Ali, prominently known as @ali_charts, has stated that Bitcoin might face resistance at \$64,300, in case of a persistent upward momentum. Highlighted Crypto News Today: Brazilian Supreme Court Lifts Starlink and X Ban Post \$3.31M Settlement

- The sanctions were withdrawn when the business paid a \$3.31 million fine. - April was the month when the problems that X was experiencing in Brazil were made public. The prohibition on Starlink and X Brazil has been removed by Justice Alexandre de Moraes of the Brazilian Supreme Court. Public displays of animosity between de Moraes and X owner Elon Musk have been going on for a while now. In Brazil, the firm encountered a brief snag that experts attribute to a cost associated with protecting free expression. The sanctions were withdrawn when the business paid 18.35 million reais, which is \$3.31 million, according to Reuters. Many are beginning to wonder what is going on, given the amount paid and how easily the sanctions may be lifted. Ongoing Tussle April was the month when the problems that X was experiencing in Brazil were made public. Elon Musk was reportedly under investigation at the time for disputing a court order that had barred specific accounts. For failing to designate a local legal representation, X was penalized by Justice Alexandre de Moraes of Brazil's Supreme Court. Despite the resolution of the financial penalty, X has been prohibited in Brazil since August 30. A political party (Partido Novo) and the country's Bar Association appealed the platform's prohibition, and the issue has now reached the country's Attorney General's Office (PGR). The PGR said on September 12 that the cases challenging the ban are without merit and that the suspension of the social networking site does not infringe on free expression rights. X and Brazil's highest court Justice Alexandre de Moraes got into an argument when he ordered the platform to remove accounts that were disseminating extremist and disinformation material, which the court saw as dangerous to Brazil's democracy. Highlighted Crypto News Today:

- Starknet token holders have completed voting for mainnet token staking according to recent reports. - The network initiated its first governance voting on September 9. Ethereum Layer-2 Starknet has been debating the idea of token staking for several months. Leading blockchain ecosystems such as Solana, Ripple, and TON allow staking for token holders. In the last few hours, following a governance voting, Starknet has finally approved mainnet token staking. Notably, the voting went live on September 10 and token holders voted on several specifications within staking. The vote saw immense support for STRK staking, where 98.94% of holders voted for the motion. Additionally, 0.61% of holders voted against staking and 0.45% abstained. Moreover, in the new mechanism users who hold more than 20,000 STRK can stake their tokens on the mainnet for rewards. Apart from this, the network has also made modifications to new token's minting mechanisms. Additionally, the current mainnet staking has been highly anticipated by the web3 community. Recently, on September 9 Starknet announced the occurrence of its first community governance voting. In order to power the governance and its mechanisms Starknet has partnered with Snapshot X, a governance protocol that aims to streamline and enhance the network's governance. Starknet (STRK) Price Overview In the last 24 hours, amid the governance voting, the Starknet token began showing upward movements in price. STRK recorded a 1.12% increase in price as per CMC data. However, the token's daily trading volume dipped by 16.13%. At the time of writing, the token was trading at \$0.3982. Zooming out, over the past week, STRK shows a modest price dip of 2.42%. At the beginning of the week, Starknet traded at \$0.4066 after which it showed upward price movements. The token hit a weekly high of \$0.4442 on September 7, this was followed by token downward movements until the last 24 hours. Meanwhile, other cryptocurrencies such as Bitcoin and Ethereum have shown struggles to sustain the previous day's positive momentum and witness price breakouts. Highlighted Crypto News Today:

The world of crypto staking is evolving at a rapid pace, and the collaboration between Binance and Solayer has helped to bring a new innovation to the forefront. BNSOL. Officially launched as a Liquid Staking Token (LST) on the Solana blockchain, BNSOL allows to combine the strengths of Binance's vast user base and Solayer's advanced restaking network, offering users new opportunities to earn rewards while participating in the security and scalability of the Solana ecosystem. Solayer's Role in Solana's Premier Restaking Network Solayer's collaboration with Binance highlights its status as the premier restaking network on the Solana blockchain. The partnership, designed to foster innovation within Solana's rapidly expanding ecosystem, showcases BNSOL as a powerful financial bridge between centralized and decentralized platforms. When users stake their SOL on Binance, they receive BNSOL tokens in return, unlocking a wide array of financial benefits as pointed out by the Solayer team. BNSOL can access staking rewards, liquidity incentives, AVS (actively validated services) delegation, and other Extractable Value (MEV) rewards. What sets BNSOL apart is its ability to integrate centralized finance with decentralized opportunities. Users are not only gaining rewards but are actively participating in enhancing the security and functionality of the Solana network. The launch of BNSOL further underscores the importance of Solayer's AVS partners. With key players like Bonk, Altlayer, SonicSVM, and Hashkey driving the security and scalability of the Solana ecosystem, Solayer has established itself as a vital component of the blockchain's infrastructure. The network has seen tremendous engagement, with over 115,000 unique wallets contributing to an all-time high total value locked (TVL) of \$190 million, much of which has been delegated to AVS partners. BNSOL Takes Liquid Staking to New Heights Through Solayer, users can delegate their BNSOL to AVS partners, adding another layer of security to Solana's Layer 1 protocol while earning additional rewards. This creates an enhanced staking model that benefits the entire network. By participating in restaking, users contribute to the bandwidth and overall performance of decentralized applications (dApps) running on Solana. Since its launch, the Solayer network has seen remarkable adoption, proving the demand for sophisticated staking solutions. Users interested in maximizing their staking potential can easily get started by staking SOL into BNSOL via Binance's SOL Staking platform. From there, the tokens can be restaked on Solayer's platform, providing even more opportunities to earn additional incentives.

The cryptocurrency market continues to evolve rapidly, with various altcoins showing potential for massive growth in the mid-term. While some of these coins started with niche appeal or meme origins, others focus on innovative solutions such as real-world asset (RWA) tokenization. In this article, we'll explore the mid-term price predictions for Toncoin (TON), Dogs (DOGS) and Rexas Finance (RXS), each of which could see significant gains in the coming months. The cryptocurrency market keeps on developing at a great pace, with several altcoins projecting several times their current value over the mid-term horizon. Some of the coins have been positioned to cater to a particular audience or for memetic purposes; others have been instrumental in focusing on the RWA tokenization. In this article, we will dig into the price forecast in the mid-term of Toncoin (TON), Dogs (DOGS), and Rexas Finance (RXS) which all have the potential to appreciate over the next months. Toncoin (TON) to Reach \$10 The rise of Toncoin (TON) in the world of crypto cannot come as a surprise because of the "functionalities" that Blockchain technology brings into play with a common messaging application such as Telegram. Still, the cryptocurrency has had several adverse incidents or controversies for instance the controversy that arose after the arrest of telegram CEO Pavel Durov which were negative in their impact. Toncoin has lost 21 % in value in the past month. Even though there have been challenges, the Toncoin has a bright outlook in the medium term. At present, TON is trading at \$5.21, 36% lower than its peak level of \$8.24 which it reached three months ago. Long story short, Changelingly data indicates that the altcoin may have hit its all-time high in November of the same year at \$8.34. The figure remains under the significant \$10 threshold but indicates a good potential for development and rise over time. Expansion of the number of users because of the popular appeal of Telegram and the development of more features within the Toncoin network could be some of the factors that will help predict how much Toncoin will surge. However, in order to achieve the \$10 target, the asset will have to deal with current factors such as regulatory challenges and the controversies surrounding Telegram. While this September may offer more of moderate relays, it may take time to hit the \$10 mark which may need more factors favourable to the market. Dogs (DOGS) Targets \$1 Having started as merely a dog meme, Dogs (DOGS) has come a long way. The coin has performed well, particularly with the help of a popular Shiba Inu mascot, similar to Dogecoin and Shiba Inu (SHIB) although on a different trajectory. The listing of the coin on the exchanges has also contributed to its growth as it has introduced the currency to other potential users and enhanced its recognition in the world of cryptocurrency. The DOGS token enjoys the loyalty of its fans grouped as the DOGS Army whose members are actively involved in marketing the token online. Such activities have fueled the fame of DOGS allowing it to gather speed ahead in the relevant market despite the stiff competition. However, moving forward and achieving even a \$1 mark does show promise but certainly is going to garner some roadblocks. Like most meme coins, DOGS is also hard on the scooter market and is subject to high fluctuations in price. Any negative information that can come even from government regulation of the market or other unwanted phenomena can greatly influence the value. Additionally, the chances of moving up may be hampered by the emergence of other meme tokens and even already renowned cryptocurrencies. That is so, after its introduction to exchange, and with the active participation of members in the project development, DOGS has been set on the right path. The token has already been pumped up by a new cycle of investors and in case the market situation will not change for the worse, we may expect a bullish trend for DOGS with ringing targets close to \$1 in the course of the next few months. Rexas Finance (RXS) Set for a Steep 100x Climb to \$4 Among the most exciting cryptocurrencies in the market today is Rexas Finance (RXS), a token that is gaining substantial attention due to its potential for steep growth. Currently priced at just \$0.03 during its presale stage, Rexas Finance is poised for a 100x climb, with price predictions estimating a surge to \$4 in the coming months. The token's focus on Real-World Asset (RWA) tokenization is the driving force behind its expected growth. Rexas Finance is dramatically transforming and making it easier for consumers by offering a blockchain-powered infrastructure to tokenize tangible assets which include real estate, commodities, and even art. This helps people to purchase, trade, and invest in fractions of physical assets which earlier seemed hard for most people because of the high threshold levels. This is a multi-trillion dollar market in RWA and as Rexas Finance opens up these assets to regular investors it is entering a potential trillion market. The presale stage of Rexas Finance has already attracted significant attention from major investors, signalling strong confidence in the project's long-term success. The RXS token allows users to participate in this innovative ecosystem, offering both liquidity and accessibility to high-value markets. Additionally, the presale has demonstrated robust performance, with investors flocking to secure their stake before the token's price rises upon its official launch. Even as the number of markets and the number of investors willing to invest in such tokenized real-world assets grow, the appreciation of the RXS price according to the \$4 implied hard cap will not be outstretched. Rexas Finance has solid financial health, a feasible and original purpose, and increasing support from institutional investors which puts it at the right place and time to grow below the level that makes it one of the best projects worth investing in, in the crypto market. Conclusion The mid-term outlook for Toncoin (TON), Dogs (DOGS), and Rexas Finance (RXS) is promising, with each offering unique opportunities for investors. While Toncoin continues to face external challenges, its association with Telegram and expanding ecosystem suggest that it could eventually reach \$10. Dogs, meanwhile, aims for \$1 as it capitalizes on its meme status and community-driven growth. However, the most exciting prospect is Rexas Finance, which is set for a 100x climb to \$4, thanks to its pioneering approach to real-world asset tokenization. With strong backing from investors and a rapidly growing user base, Rexas Finance could be the standout performer in the coming months, offering both short-term gains and long-term growth potential. - eToro has agreed to pay a settlement of \$1.5M and stop breaking federal securities regulations. - Only Bitcoin, Ether, and Bitcoin Cash would be traded by consumers in the U.S as per the deal. e-Toro, a trading platform, and the United States Securities and Exchange Commission (SEC) have

announced a settlement. The business's cryptocurrency trading platform was at the center of a regulatory battle with the SEC, which claimed the firm was using its services as a clearing agency and broker without proper registration. A lot of people think that the continued crackdown on crypto companies by US authorities is limiting innovation. After allegations of providing cryptocurrency trading services without registration surfaced, the platform and the SEC came to an arrangement. The securities regulator said in a press statement dated September 12 that eToro has agreed to pay a settlement of \$1.5 million and stop breaking federal securities regulations. Only Three Cryptocurrencies Permitted The business will keep its activities in the United States while maintaining compliance with applicable regulations, according to Gubir Grewal, Director of the SEC's Division of Enforcement. Both investors and other crypto intermediaries stand to benefit from this resolution's strengthened protections. In light of its commitment to end its violations of relevant federal securities laws, eToro has agreed to pay a \$1.5 million fine and maintain its operations in the United States. Moreover, the deal calls for the business to cut ties with almost all cryptocurrencies. It was revealed in the announcement that only Bitcoin, Ether, and Bitcoin Cash would be traded by consumers in the United States. Within 180 days after the Commission's ruling, users will have the option to sell additional assets. While negotiating the settlement, eToro laid forth its future goals, one of which is to provide transparent regulatory frameworks. Highlighted Crypto News Today: Solana (SOL) Targets Rise to \$155 and \$160: But There's A Catch

- This important inflationary gauge comes amid increasing speculations in anticipation of a rate cut. - Aside from food and energy, the released data shows the US core PPI increased by 0.3%. The data from the United States Bureau of Labor Statistics, released on Thursday, show that the US PPI inflation increased 0.2% in August. This aligns with the Dow Jones consensus estimate teased before the readings came out. This important inflationary gauge comes amid increasing speculations in anticipation of a rate cut by the Federal Reserve. The Producer Price Index measures the final demand goods and services costs that producers receive. Aside from food and energy, the released data shows the US Core PPI increased by 0.3%, which is a little higher than the 0.2% consensus estimate. Noteworthy, this core increase remained the same even when trade services were excluded. Rate Cut Likely by Fed Based on 12-month trends, the headline US PPI saw a 1.7% increase. Similarly, the annual rate hit 3.3%, excluding food, energy and trade. Service prices contributed significantly to the PPI measure, with as much as a 0.4% monthly increase. This came from services like trade, transportation and warehousing. Guestroom rental with a 4.8% surge, was also a major contributor to the metric. Chris Larkin, managing director of trading and investing for E-Trade at Morgan Stanley noted that the alignment of PPI's repetition of yesterday's US CPI inflation reading as well as its jobless claims with expectations, clears the decks for the Fed to kick off a rate-cutting cycle. The markets are anticipating an initial 0.25% cut, but the discussion will soon turn to how far and fast the Fed is likely to trim rates over time, he added. At the time of writing, Bitcoin is trading at \$58,237 as per data from CMC. Highlighted Crypto News Today: Solana (SOL) Targets Rise to \$155 and \$160: But There's A Catch

- Bybit outperforms Binance and Coinbase with an impressive 2738% average Day 1 token price surge. - Bybit's regulatory progress in Kazakhstan signals its influence in the crypto market. A recent report by Simplicity Group Research reveals that Bybit has emerged as the leading platform for Day 1 token price performance, surpassing Binance and Coinbase. The report examined token performance across Binance, Coinbase, OKX, Gate.io, MEXC, Bybit, and KuCoin, focusing on their average price changes after listing. According to the findings, Bybit's Day 1 token price surge averaged a remarkable 2738%, making it the top performer among the eight exchanges studied. This is significantly higher than Binance's average increase of 111% and Coinbase's 24% gain on Day 1. Bybit's Token Volatility and Market Impact However it cautions, as the volatility of these tokens can lead to significant price drops following the initial surge. Bybit tokens experienced a dramatic 1906% drop from Day 1 to Day 2 and a 31% decline in value after Day 2, reflecting the high volatility in the market. The report also pointed out that while the tokens showed strong initial performance, liquidity, and price stability remain critical. Despite these challenges, Bybit's strong liquidity and high demand for newly listed tokens underscore its dominance in this area. Shifting focus, a recent report reveals that Solana is poised for significant growth in decentralized finance (DeFi), driven by its innovative approach to liquid staking. Finally, Bybit has also made headlines with a massive transfer of 4 trillion PEPE tokens, valued at approximately \$29.8 million, sparking speculation about a potential price surge for the popular meme coin. Bybit's recent regulatory achievements in Kazakhstan and its push for crypto adoption further underscore its growing influence in the global crypto market. Palo Alto, CA, September 12th, 2024, Chainwire Super Champs Chain will Accelerate Growth with New Games from Builders; Super Champs already the Top Gaming Ecosystem on Base with Two Live Games and More to Come The Super Champs Protocol Foundation is excited to announce the launch of the Super Champs Chain "a cutting edge gaming optimized L3 that rolls up to the Base blockchain from Coinbase. Built on the web3 game publishing platform and protocol from Joyride Games, the Chain also includes the BuilderKit, a development, growth, and live operations suite for mobile studios. The Super Champs Chain represents the next step in the Foundation's vision to build a games franchise powered by web3 community, proprietary IP, and mobile game tooling. Super Champs is an anime-inspired universe where superhero athletes use their powers to compete across multiple action sports. Super Champs already has two popular mobile games built by Joyride Games, Racket Rampage and Bullet League, and a Super Champs HQ web-based, questing experience tailored for cryptonatives. Since launching in June, Super Champs has become the top games ecosystem on the Base blockchain with 5MM+ total game installs, 125k+ onchain daily active users, 700k+ onchain monthly active users, 250k+ X followers, and 650k+ YouTube and TikTok subscribers. These blockchain games currently represent ~10% of all daily users on Base, and migration to the L3 will make it a Top 5 gaming blockchain with current activity alone. "The Super Champs ecosystem has seen dramatic growth already, and it is poised to grow further with the upcoming launch of the \$CHAMP token. We aim to build the first scaled web3 gaming franchise, immersing the community in multiple mobile games and a deep story-based universe," said Vivek Nallavelli, Director of the Super Champs Protocol Foundation. "Our next mission is to empower Builders to bring new, high quality game experiences set in the Super Champs Universe to our engaged community." The Super Champs L3 Chain on Base is built on Joyride's game publishing platform and protocol for web3 mobile games. The Chain uses the Arbitrum rollup stack to achieve rapid and low-cost transaction processing and a gas-free experience for consumers, making it an attractive solution for studios to create immersive game experiences for players. This architecture offloads complex computations from Base, scaling horizontally as part of Joyride's omnichain network to handle increasing load while inheriting the security guarantees of the Ethereum blockchain. The BuilderKit complements the blockchain infrastructure by offering studios a cutting edge mobile optimized tool to build, grow, and manage their games. Builders are looking to see Super Champs generating such excitement for its games and animated series on TikTok and YouTube, said Omar Siddiqui, Founder & CEO of Joyride Games. "As the first mobile games ecosystem built on our publishing platform and protocol, we can't wait to see every studio building a Super Champs game accelerate its growth with access to world-class infrastructure. Our long term vision has always been for Super Champs to introduce a new web3 paradigm for game franchises, and it's thrilling to see it come to life." With the announcement of the Chain and BuilderKit, Super Champs is evaluating ideas for new games from Builders who want to take advantage of its novel IP and thriving community to build new games. "We're still in the nascent stages of understanding the true potential of web3 gaming, and there's no other web3 native mobile game IP that has already generated early momentum like Super Champs," said Scott Rupp, Founding General Partner at BITKRAFT Ventures. "Today's announcement makes it easier than ever for game developers to build in the robust Super Champs ecosystem, taking us another step closer to decentralization and bringing web3 experiences to the mainstream." About the Super Champs Protocol Foundation The Super Champs Protocol Foundation supports the growth of Super Champs, an anime-inspired web3 franchise powered by community, proprietary IP, and a suite of mobile game tooling for development, growth, and live operations. The Foundation is backed by top investors and web3 ecosystem participants such as Coinbase Ventures, Animoca, SuperLayer, and leading industry figures such as Gabby Dizon of YGG, Elliot Trades of SuperVerse, and Giulio Xiloyannis of MON Protocol. The Super Champs franchise is now the top game ecosystem on Base, with two live game experiences and a cryptonative web experience attracting 125k+ onchain DAUs, 700k+ onchain MAUs, and animated storytelling content with 650K+ subscribers and 10MM+ views across TikTok and YouTube. About Joyride Games Joyride Games is a games and infrastructure company supporting the development of web3 game ecosystems to build next generation franchises. Led by veteran game developers from Disney, Electronic Arts, and Zynga, Joyride has built onchain mobile games, infrastructure, and protocol that have onboarded 10MM+ players to web3. Super Champs is its most recent ecosystem project, and it has partnered with the Super Champs Foundation for its launch. Backed by leading blockchain and game investors such as BITKRAFT, Solana Ventures, Dapper Labs, OKX Ventures, KuCoin Ventures, and OpenSea, Joyride has raised \$30MM to execute on its vision of player-owned franchises. Joyride's web3 game publishing platform and protocol is optimized for mobile games. It includes an omnichain network to support multiple game ecosystems and builder tools encompassing web3 and web2 to develop, operate, and grow high quality mobile games. As market liquidity dries up and both the global economy and the crypto market sink into a general downturn, macroeconomic factors loom like the sword of Damocles. In such a challenging environment, maintaining profitability or avoiding losses in the market is not an easy task. More often than not, the ability to make the necessary adjustments based on real-time conditions, without being limited to the present, is a difficult strategy to master. However, the recent Gem's campaign, co-hosted by iBank and the Polkadot ecosystem, offers the first 4,000 users who complete the tasks the opportunity to share a prize pool of \$300,000 in PLMC tokens, with the top prize valued at \$10,000. This high-reward, fast-paced trading event perfectly aligns with the current mindset of most traders, requiring little luck but quick participation. The Gem's Super Gains represents the ultimate leverage for both speculators and investors, helping them conserve their strength during the market downturn while preparing for the next bull market or guarding against the risks of further declines. 1. High Returns High returns are prioritized due to the efficiency between investment and returns, particularly given the current awkward situation of shrinking market profits. The rewards are divided into two parts: PLMC earnings and gotEM earnings (obtained via voting). Due to the limited information available on gotEM and the uncertain value of these tokens, we'll exclude them from our calculations for now. Further explanations will be provided if official updates become available. Let's calculate the returns from participating in both activities, which are closely tied to two prize pools: 1. The main prize pool consists of \$270,000 worth of PLMC rewards, distributed to the first 4,000 users. According to the "first served" principle, the average reward per user would be approximately \$67.5 (270,000 / 4,000). After deducting transaction fees and KYC costs, the net prize pool consists of \$260,000, with the top individual user would be a \$10,000 PLMC tokens. According to the event rules, one lucky user will receive a \$10,000 PLMC reward, while 20 users will each receive \$1,000 in PLMC tokens. Based on this logic: - The maximum return on investment could be as high as 838,816.67%. - The minimum return on investment could be 88,816.67%. | Individual (\$) | Cost (\$) | Return (\$) | ROI | | Average | 67 | 1.2 | 65.8 | 5,483.33% | | Max | 10,067 | 1.2 | 10,065.8 | 838,816.67% | | Min | 1,067 | 1.2 | 1,065.8 | 88,816.67% | But Why All the Fuss? Compared to other events on the market, Super Gains not only offers extremely high returns but also has a favorable winning probability. For users looking to earn high returns at a low cost in the crypto market, this is an opportunity not to be missed. Simple, right? Execute simple tasks correctly, and the value far exceeds what most speculators and investors can achieve, positioning you as the fortunate "survivor bias." 2. High Market Potential For a long time, Launchpad platforms have been regarded as wealth-creating machines, gaining strong traction in the market. The idea is simple: Launchpad platforms continuously launch new project tokens, and the platform's native token serves as the primary participation method for both B2B and B2C sectors. With its application scenarios, Launchpads have greater potential and future value compared to other types of projects. On-chain data shows that Polkadot is growing steadily and gaining high participation, with a noticeable upward trend. According to reports, PLMC is the token of the Polimec project, which was conceived by the KILT Protocol team at the end of 2020. The project aims to realize the vision of the first decentralized, community-driven web3 funding protocol. PLMC currently offers functionalities such as Evaluation, Participation, Staking, and Governance. Official sources have hinted at future upgrades, including reducing the early 49-day staking period to 21 days, increasing efficiency. Despite the current market downturn, Polimec's high frequency of IDOs and strong fundraising capabilities are its unique competitive advantages. Unlike other platform tokens, PLMC launched with a lower valuation, without high FDV (Fully Diluted Valuation) or risks of fraud or dumping. It has been gaining attention for several months and boasts a large community, making it one of the most active projects in the Polkadot ecosystem. According to market data, the average return from IDO Launchpads is about 44x. If you spend just \$1 to get \$67 worth of Launchpad tokens, the growth potential during the altcoin season could soar 10x or more, translating to approximately \$670 in rewards. 3. Stay Energized and Engage Actively Only when the tide goes out do you discover who's been swimming naked. In a market with shrinking liquidity, financial strength, capability, and market influence become key forces. For most investors, improving risk management while achieving returns within their means is crucial. Instead of spending tens of dollars on gas

fees for on-chain transactions, why not participate in a high-reward, high-potential game like this? First come, first served! LBank and its partners have also provided a detailed participation guide for the event, ensuring that even novice users can participate smoothly. Participation guide Regarding one of the event's co-hosts, gotEM, there has been limited information disclosed so far. The event organizer of the Super Gains event has confirmed that gotEM's involvement is well-defined and will be gradually shared with market participants as the event progresses. More benefits will also be distributed, so stay tuned for updates. With high rewards and clear participation guidelines, the Super Gains event, co-hosted by LBank, Deloitte, and the Polkadot ecosystem, has attracted widespread attention and participation. Be sure to act fast and become one of the first 4,000 users to capture high-value returns and secure stable earnings! Disclaimer: TheNewsCrypto does not endorse any content on this page. - El Salvador accumulates Bitcoin daily, reaching 5,871 BTC. - Mixed public adoption, with 88% of Salvadorans not using Bitcoin. El Salvador has made headlines once again in the cryptocurrency world by consistently adding one Bitcoin to its national reserves every day for the past 665 days, regardless of market conditions. This accumulation strategy has brought the government's Bitcoin holdings to 5,871 BTC, currently valued at approximately \$342 million. ðŸŒŸ ðŸŒŸ El Salvador keeps stacking 1 #Bitcoin daily for the past 665 days, no matter the market! â€” Spot On Chain (@spotonchain) September 12, 2024 The government now holds 5,871 \$BTC (\$342M), with 3,046 \$BTC publicly known to be bought at an average price of only \$43,888. Follow @spotonchain and check out the #ElSalvador BTC walletâ€¦ pic.twitter.com/yeUgyqWfMV President Nayib Bukele's administration began this daily Bitcoin purchase initiative in an effort to build a digital asset reserve while embracing Bitcoin as legal tender. Of the 5,871 BTC, 3,046 are publicly known to have been purchased at an average price of \$43,888 each. Despite the volatile nature of the cryptocurrency market, the Salvadoran government has maintained its commitment to Bitcoin. Bukele's Bitcoin game started in September 2021, when El Salvador became the first country to officially adopt the cryptocurrency as legal tender. The move aimed to boost financial inclusion in a country where 70% of the population does not use traditional banking services, reducing reliance on remittances. However, Bitcoin's adoption in the country has faced challenges. A survey conducted by the University Institute for Public Opinion revealed that 88% of Salvadorans have yet to use cryptocurrency. Despite this, Bukele remains steadfast, noting in a recent interview that while Bitcoin hasn't achieved widespread adoption, it has benefited those who chose to embrace it. Long-Term Confidence In Bitcoin El Salvador's strategy has also drawn attention from international institutions, particularly the IMF, which has raised concerns about potential risks but agreed to a preliminary loan deal with the country in August 2023. For now, El Salvador continues to stack Bitcoin, making a long-term bet on the cryptocurrency's future as a key component of its economic strategy. El Salvador's bold Bitcoin strategy reflects its unwavering belief in cryptocurrency's potential, despite mixed adoption and international scrutiny. Highlighted News Of The Day

As of the beginning of the last quarter of 2024, there is a lot of hope in the cryptocurrency market, and investors are looking at some specific assets that should give massive returns to investors. And the top-performing digital currency for Q4 2024 will most likely be Ethereum (ETH), Solana (SOL), and the up-and-coming Rexas Finance (RXS). Though each possesses abnormalities, they are expected to emerge well above the average market trends. The analysts are predicting very aggressive growth in the price of these currencies and only the positive trends upward will prevail on these three. In particular, Ethereum is getting back to the \$3000 threshold, Solana will be able to reach the level of \$200 and Rexas Finance seeks a rise of almost 35x to a dollar. Ethereum (ETH) Poised For A Rebound to \$3,000 By Market Cap, Ethereum Lays Second in Position after Bitcoin since its introduction in the market up to this time. Rivalled only by Bitcoin, these antagonists undermine the cryptographic structuring of the transactions primarily executed on the Ethereum network. Even considering the recent challenges of staking and lending, and investing in the tokens because of the market instability, legal changes, and competition from other ecosystems, the prospect of Ethereum looks very good. Ethereum 2.0 is, among other factors, a catalyst for a strong rebound of Ethereum near the level of \$3,000 by the end of Q4 2024. This also came with benefits such as emission reduction and scalability improvement which have historically been some of the challenges for Ethereum. Working with Ethereum 2.0, the network has been attracting more users, developers, and investors as its cost per transaction at higher transaction scales has considerably come down, increasing the demand for ETH. In addition, the growth of Layer 2 solutions such as Arbitrum and Optimism, which aim at scaling Ethereum and reducing its transaction costs, has also increased its ecosystem. Such solutions entail avoidance of using on-chain transactions as much as possible and rather use off-chain transactions then net these on the Ethereum main chain thus achieving speed and reduction of costs without compromising the security and decentralization that Ethereum has been known for. Solana (SOL) to hit \$200 Even referred to as the "Ethereum Killer", Solana (SOL) has made a great contribution to the development of the blockchain industry owing to its rapid speed and low costs. With the help of this consensus, the so-called proof of History (PoH) Solana can perform more than sixty-five thousand transactions within one second, a record high in nearly all blockchain systems in the world at the moment in time. This speed and efficiency to process transactions have also attracted more and more developers and projects within the Solana ecosystem, especially in the areas of decentralized finance (DeFi), NFTs, and gaming dexes. Looking forward to the further growth of Solana it can be predicted in only two more years that it will reach the price of \$200 which occurs at the end of Q4. First, it is observed that there is an increase in both developers and users of Solana for the bullish forecast. The market activities have grown rapidly as there are several decentralized finance protocols, NFT platforms, and gaming applications that are being developed on Solana because of its excellent scaling and very cheap fees. This increasing adoption is expected to create an appetite for SOL, the native token of the Solana Network. Moreover, Solana is growing its presence in the area of institutional adoption. A few institutional giants in the industry are realizing the promise of the network as one that has the capability of shaking up the existing financial setups. Solana's collaborations with large-scale ventures and corporations also fortify its chances of salons in the future. Rexas Finance (RXS) Targets 35x Jump to \$1 Even though both Ethereum and Solana are the market giants with dominance in cryptocurrency trading, the impressive section Q4 2024 may most likely be taken by Rexas Finance (RXS), which is a subsidiary, entering Real World Asset (RWA) tokenization. Rexas Finance is currently in the first stage of its presale at \$0.03. It is, however, a matter of a few days and weeks before it reaches \$1 according to analysts' predictions regarding the status of the asset considered to be hyper-monetary by a factor of 35. Rexas Finance is set to innovate the trading and management of physical assets like real estate, commodities, and even art through blockchain technology. In the real economy, Rexas Finance enables users to convert physical assets into tokens which makes issues in classical asset management such as liquidity, low investment volume, and long setup of the deals. One facet of the platform's rich environment is the Rexas QuickMint Bot, which enables users to mint tokens directly from Telegram and Discord channels. This allows even non-technical users to tokenize and invest their assets in blockchain thereby promoting further adoption. Furthermore, Rexas Finance provides users with the Rexas Launchpad, which is a token-selling fundraising platform that is already attracting start-ups and entrepreneurs wishing to harness blockchain technology in their ventures. As the ecosystem of Rexas Finance develops and grows, the need for its internal coin RXS is expected to reach hitherto unanticipated heights. Strong interest fundamentals supporting positive cost action in sync with the visionary plans suggest, the prediction of \$1 in Q4 2024, a thesis of a 35x rise sounds reasonable. Current presale investors who buy at \$0.03 will be in for massive windfall returns as Rexas Finance develops and reaches its full position. The assets liquid, accessible, and transparent. This disruptive model focuses on resolving some of the persistent Conclusion In light of the scenario that we find ourselves within, as we approach the end of the year 2024, it is most likely that the performance of three cryptocurrencies namely, Ethereum, Solana, and Rexas Finance, will be the top-performing in the market. Due to Ethereum's continuing lead in DeFi and NFTs, Solana's unrivaled speed and scalability, and Rexas Finance's incentive performance on RWA tokenization all these cryptos are positioned to benefit from the upcoming wave of the crypto market. Indications are that both Ethereum and Solana will fight their way back to critical price levels. However, the presentation of Rexas Finance has something quite different for the early investors who are willing to take risks, as thus the reason to believe that Q4 2024 will pose further great things for investors with this project. Crypto insider opinions often shape investor sentiment, and one crypto expert has recently spotlighted an altcoin that he believes holds greater millionaire-making potential than Shiba Inu (SHIB) or Pepe Coin (PEPE). With the market seeing volatility across various meme coins, the altcoin in question, Rexas Finance (RXS), is gaining attention for its real-world applications and revolutionary tokenization features. Shiba Inu (SHIB) Market Realities Shiba Inu has long been at the center of the meme coin frenzy, with its initial meteoric rise capturing the attention of crypto investors. However, experts like Zach Humphries have cautioned that Shiba Inu (SHIB) explosive growth may not be sustainable in the long term. While there are expectations of a bull run for Shiba Inu (SHIB) lasting 8 to 15 months, Humphries warns that investors should temper their hopes, as the days of skyrocketing Shiba Inu (SHIB) prices by thousands of percentage points are unlikely to return. Pepe Coin (PEPE) Presents A Mixed Future Ahead Pepe Coin, another meme token with viral popularity, faces an uncertain future. Although its market cap sits at \$3.06 billion, recent trends show a 33% decline. Pepe Coin (PEPE) has been trading at \$0.0000727 with a 14% drop in the past month, leaving investors to speculate whether Pepe Coin (PEPE) will break resistance levels or continue its downtrend. Some analysts predict a 3-5x return potential for Pepe Coin (PEPE), but with the crypto market still subdued, PEPE's performance remains in question, and its growth may be capped due to its already large market cap. Rexas Finance (RXS): A New Era in Asset Tokenization Rexas Finance, the altcoin currently attracting attention, offers far more than just hype. Its foundation lies in the tokenization of real-world assets, making it a revolutionary force in both blockchain and traditional asset markets. Rexas enables users to tokenize physical assets like real estate, gold, and even art, allowing investors to purchase full or fractional ownership with a single click. With its ERC-20 token standard and a total supply of 1 billion tokens, Rexas Finance has positioned itself to bridge the gap between blockchain technology and traditional asset markets. By transforming how assets are traded, Rexas has opened up a potential market valued at trillions of dollars, including the \$379.7 trillion real estate market and the \$121.2 trillion commodities market. Rexas Token Builder: Empowering Asset Tokenization One of the standout features of Rexas Finance is its Token Builder, a tool that simplifies asset tokenization for all users. The Token Builder allows anyone, regardless of technical knowledge, to create tokens representing their assets. Rexas Finance has also introduced a QuickMint Bot, which facilitates instant token creation through popular messaging platforms like Telegram and Discord. Real estate tokenization forms a core part of the Rexas Finance platform. Rexas Estate allows for fractional ownership of properties, making real estate investment accessible to a much broader audience. In addition to real estate, Rexas offers several other innovative utilities, such as GenAI for NFT creation and AI Shield, which enhances security for smart contracts. Rexas Presale: A Unique Opportunity for Investors Rexas Finance is currently in its public presale stage, with 8.86 million RXS tokens sold at \$0.03 per token. The presale has already raised over \$268,775 of its \$450,000 goal for stage 1. One key aspect of Rexas Finance's presale is its focus on public participation rather than relying on venture capital. By doing so, Rexas aims to give regular investors the chance to be part of this revolutionary project. Investors who participate in the presale at stage one will see their investments multiply by six times. Conclusion Rexas Finance stands out in the crypto market, offering real-world utility through the tokenization of physical assets. While meme tokens like Shiba Inu and Pepe Coin face uncertain futures, Rexas is already delivering innovative solutions that are reshaping how assets are traded and owned. CARV is introducing a \$50 million accelerator program to support initiatives that have the potential to propel the widespread adoption of its eponymous data protocol. The modular data layer for gaming and artificial intelligence, which has the support of leading blockchain venture capital firms like Consensys and HashKey Capital, has pledged to help innovators, especially those who are actively creating the decentralized data of the future. The accelerator, which is backed by the CARV Protocol, aims to make it possible for users to manage and profit from their data via a dynamic, decentralized data infrastructure. In addition to funding and investments supported by top industry funds, it will provide entrepreneurs complete support in the form of go-to-market and growth assistance, professional tokenomics consultation, infrastructure and tooling tech help, and access to the company's industry network and community. CARV Co-Founder Victor Yu stated: â€œOur goal is to enable a decentralized data ecosystem for broader innovation. Building sustainable data infrastructure hinges on creating a dynamic data flywheel, which requires modular infrastructure

and a critical mass of high-quality applications post-PMF. To push for the next hockey stick, we want to further encourage building by more players. In addition to providing direct funding and investment, CARV Labs will prioritize infrastructure and tooling assistance from CARV and its network partners, as well as provide marketing and growth support, community development, and tokenomics advising services. The web3 division of South Korean mobile game developer Netmarble, Intella X, the web3 publishing division of Global Game Developer and Publisher NEOWIZ, the crowdfunding platform Alphastarter, Doublejump.tokyo, the developer of the Oasys blockchain, a number of business angels, game publisher Xterio, and the Solana, NEAR, and Ronin networks are among the current industry investors scheduled to participate in the accelerator's vertical-specific programs. Alibaba Cloud, Arweave, Litentry, and the Linea Ecosystem Investment Alliance (LEIA) are among the other partners that will be promoting the accelerator. Later this year, Linea, the secure zkEVM L2 that enables dapps to flourish, will promote a web3 gaming offer that will link to the accelerator. In only 4 weeks, BANANA, the idle game developed on the TON ecosystem and the first startup incubated under CARV Labs, drew over 8 million players, with over 1 million daily active users, 1.8 million linked social profiles, and 73 million social activities accomplished. The quick success of BANANA is evidence of CARV Labs' ability to stimulate creativity and increase user involvement in decentralized apps. This accomplishment establishes CARV Labs as a pioneer in the field and highlights the possibilities for other initiatives. CARV has made over \$5 million in revenue so far this year thanks to the wave of apps that are based on the protocol, and additional games and projects are in the works. The 40K validator nodes that were given to the community worth \$30 million were used to power the company's Alphabet, which was launched last month. As CARV develops into a completely decentralized scalable protocol layer, the milestone was deemed significant. After a \$10 million Series A fundraising round headed by Tribe Capital and IOSG Ventures in April, Alphabet made its debut. Projects in the gaming, AI, and data infrastructure domains that would want further information about the new accelerator are encouraged to get in touch via CARV's official Discord channel.

- Hoskinson denies ADA staking and market cap rumors. - Cardano's staking is liquid and non-custodial. Cardano founder Charles Hoskinson recently expressed his frustration over increasing misinformation regarding ADA staking and market cap manipulation. These false claims have become widespread, reaching what Hoskinson described as "epic levels." A particular rumor asserts that ADA holders are trapped in staking pools. Consequently, this situation prevents them from selling their tokens and artificially inflates ADA's market cap. This misinformation spread quickly after crypto commentators discussed it on a podcast. The commentators claimed that staking restrictions in Cardano's ecosystem made it difficult for ADA investors to liquidate their holdings. Hoskinson quickly addressed these false claims, emphasizing that Cardano's staking system differs from those of other projects. Unlike many blockchain networks, Cardano offers a liquid, non-custodial staking model. This means that ADA holders can stake their tokens without locking them up, allowing them to withdraw or trade their assets at any time. This model provides flexibility for investors while ensuring that the ADA ecosystem remains decentralized and secure. Cardano Community Debunks Staking Rumors. The Cardano community also played a crucial role in debunking these rumors. Community members highlighted that ADA tokens are never locked in staking pools. Instead, they are always available for use, even while earning rewards. This approach ensures that ADA's market cap accurately reflects the circulating supply and prevents artificial inflation from forced staking. In response to the growing misinformation, Hoskinson urged the crypto community to verify facts before spreading information. He reiterated that Cardano's staking system is designed to be both user-friendly and transparent, with no hidden mechanisms that would restrict token liquidity or manipulate market metrics. The incident highlights the importance of accurate information in the cryptocurrency space. As Cardano continues to grow, Hoskinson and the community remain committed to transparency and education, ensuring that ADA investors have the facts they need to make informed decisions. Highlighted Crypto News Today Memecoin Sector Bleeds Red Under Bearish Dominance

- Leading memecoins such as DOGE, SHIB and FLOKI showed significant price dips in the past day. - WIF recorded the highest price dip in the overall market with a 3.3% decline. The overall crypto market has been oscillating between a price recovery and modest price dips these past few weeks. Leading cryptocurrencies are showing obvious struggles to surpass their respective resistance levels after the recent dip. Meanwhile, the memecoin sector garnered community attention in the last 24 hours, as top coins began dipping significantly. Notably, over the past day, leading memecoins have recorded price declines apart from some of the tokens being the top losers of the day. The largest memecoin Dogecoin (DOGE) recorded a price decline of 3.11%. SHIB followed closely with a 1.57% daily decline in prices. On the other hand, significant memecoins like WIF, POPCAT, and FLOKI showed the highest dips and appeared on the Top Losers list. dogwifhat (DOG) on inferring the memecoin's daily price chart, dogwifhat (WIF) has shown a 7.39% decline in price. At the beginning of September 11, the token began to slide downwards in price to reach current trading levels. At the time of writing, the token was trading at \$1.561 as per CMC data. Additionally, the token's 9-day SMA stands above the current trading price indicating the bearish trend. This bearish trend is reflected in the token leaning towards a selling market sentiment. The token's RSI stands at 47.52 highlighting the aforementioned selling pressures. POPCAT (SOL) (POPCAT) Solana-based memecoin POPCAT recorded the second-highest price dip within the memecoin sector. The token, after attempting to witness a price breakout momentarily, succumbed to bearish movements sliding 6.35% over the past day. Additionally, the memecoin's short-term 9-day MA stands below the long-term 21-day MA indicating the bearish trend. According to TradingView data, POPCAT slid to an intraday low of \$0.5592. At the time of writing, the token was trading at \$0.5784. FLOKI (FLOKI) The gaming token and one of the leading memecoins, FLOKI also recorded significant price declines in the past day. According to CMC data, FLOKI's price fell 4.79% as the token sparked bearish candles in the Asian early morning hours of September 11. At the time of writing, FLOKI was trading at \$0.000121 as per CMC data. Additionally, FLOKI's price movement recently witnessed a death crossover in its moving average in August. The token's 200-day MA currently stands above the 50-day MA indicating a bearish run. Highlighted Crypto News Today:

- Altcoins are showing resilience as BTC's dominance declines, with a 4.4% spike in the market cap. - Top altcoin gainers ICP and AAVE, saw over 10% growth, while STRK, WIF, and AR dropped by 6%. As we enter the final quarter of 2024, the cryptocurrency market stands on the brink of potential upheaval and opportunity. The Q4 has been marked by heightened activity and bullish trends, making it a prime time for investors. However, analysts have noted a growing resilience in altcoins, despite Bitcoin's recent downturn. BTC's price dropped to as low as \$52,827 on September 7, marking a 10.8% decline from the previous week. Although Bitcoin has partially recovered to \$56,001, remaining below the \$60,000 level mark as seen on August 30. The data reveals that BTC's dominance in the market has decreased by 1.3%, with its current dominance at 57.23%. This decline, coupled with a 4.4% increase in the market cap of cryptocurrencies except the top 10, suggests that investors might be diversifying away from BTC and shifting to alternative assets, such as altcoins. Moreover, the total altcoin Open Interest (OI) has dropped by 55% excluding ETH, from its all-time high. Pseudonymous crypto trader Emperor suggests that altcoins might continue to outperform BTC, signaling proximity to a parabolic phase in the altcoin cycle. Altcoin Performance and Market Trends as 2024 Nears Its End Another notable altcoin, Solana (SOL) is trading at \$132.66, with whale activity and strong metrics suggesting a breakout to \$145-\$150. With BTC and Ethereum ETFs approved, Solana is a potential next candidate despite SEC skepticism. Dogecoin (DOGE) has shown recent bullish signs, with a 5% increase over the past week, following BTC's rebound. Despite this, DOGE has struggled to break the \$0.12 ceiling and is currently priced at \$0.10. Top gainers in altcoins are Internet Computer (ICP), and Aave (AAVE) with over 10% increase in the past 24 hrs. And losers in the list are, Starknet (STRK), Dogwifhat (WIF), and Arweave (AR) experiencing a 6% dip in the past day. In conclusion, as we approach the end of 2024, the cryptocurrency market is poised for significant movements. Investors closely analyze altcoin performance, Bitcoin dominance, and market sentiment to strategically position their portfolios for potential gains. Highlighted Crypto News Today: Is Bitcoin (BTC) Entering a Prolonged Slump Below \$58K?

In a surprising turn of events, a prominent Cardano (ADA) whale who has held a significant position since 2017 has recently liquidated their ADA holdings. This whale, a longtime believer in Cardano's potential, has now shifted focus to an emerging Real-World Asset (RWA) tokenization project, signaling a growing trend among large investors seeking alternative assets with greater utility. This move is significant not only because of the whale's influence in the broader Cardano ecosystem, but also because it highlights a rising interest in RWA-focused projects like Rexas Finance, which offer real-world applications in sectors like real estate, commodities, and intellectual property. The Whale's Journey: From Early ADA Adoption to New RWA Investment The Cardano Whale first invested in ADA in 2017, during the early days of the platform's launch. With Cardano's ambitious goals of improving blockchain scalability, security, and sustainability through its proof-of-stake (PoS) model, the whale remained a loyal holder throughout both bull and bear markets. Over the years, ADA's price fluctuated, reaching highs during the 2021 bull run but later struggling to maintain momentum as competition within the smart contract space intensified. However, as new opportunities emerged, particularly in the growing RWA tokenization sector, the whale decided to liquidate a significant ADA position. This strategic exit aligns with a broader trend where major investors are seeking utility-based projects that integrate blockchain technology with real-world applications. The whale's decision to transition to Rexas Finance, a platform focused on tokenizing real-world assets, signals a shift in sentiment towards more tangible use cases and diversification. Why Cardano (ADA) Holders Are Looking Elsewhere Cardano has been one of the most influential projects in the crypto space since 2017, but in recent years, it has faced stagnation in terms of development speed and ecosystem growth. While ADA has made strides in decentralization and sustainability, it has lagged behind newer projects that offer immediate utility and DeFi integration. The whale's exit may be driven by a perceived lack of recent developments or excitement surrounding Cardano's roadmap. Despite its promises of groundbreaking technological advancements, Cardano's ecosystem growth has been slower compared to projects like Ethereum, Polkadot, and Solana. This has caused some investors to seek out emerging sectors like RWA tokenization, which are seen as offering more practical applications and stable returns. Additionally, broader trends in the crypto market are steering investors away from speculative cryptocurrencies and toward assets that offer real-world value, such as the tokenization of assets like real estate and commodities. These projects provide an alternative investment model with potentially lower volatility and a clearer path to long-term profitability. What is RWA Tokenization? Real-World Asset (RWA) tokenization is an innovative concept that allows physical assets to be represented as digital tokens on a blockchain. This process enables fractional ownership, trading, and management of assets like real estate, precious metals, and intellectual property on decentralized platforms. The RWA sector has garnered significant interest in recent years as investors recognize its potential to unlock liquidity in traditionally illiquid markets. By tokenizing assets, investors can participate in fractional ownership, lowering the entry barriers for high-value assets and creating more diverse investment opportunities. The blockchain's transparency and smart contract technology further enhance trust, making RWA tokenization a promising sector for stable and profitable returns in 2024. The ADA Alternative: A New Player in the RWA Space As the whale divests from ADA, they are now accumulating a new player in the RWA space: Rexas Finance (RXS). This emerging blockchain project focuses on tokenizing real-world assets to provide decentralized finance (DeFi) solutions that bridge traditional finance and crypto. Rexas Finance stands out with its no-code token creation tools, AI-powered NFT generation, and multi-chain integration for seamless transactions. Unlike ADA, which has primarily focused on improving blockchain infrastructure, Rexas Finance directly integrates with real-world markets, making it a more utility-driven project. Its focus on the RWA sector provides investors with exposure to tangible assets, offering a potential hedge against the volatility commonly associated with cryptocurrencies. Rexas Finance's use of DeFi protocols to enhance liquidity and enable yield farming further adds to its appeal, positioning it as a high-growth alternative to ADA. Why RWAs Are Attracting Cardano Whales and Large Investors The move from ADA to RWA tokenization projects like Rexas Finance reflects a broader shift in investment strategies. Whales and large investors are drawn to the stability and utility that tokenized real-world assets offer. Unlike speculative tokens, RWAs are backed by tangible assets, which provide real-world value and help reduce risk. For example, tokenizing real estate allows for easier buying, selling, and fractional ownership, transforming traditionally illiquid assets into more liquid and tradable assets. This increased liquidity appeals to whales looking for diversification and more consistent returns in the volatile crypto market. Cardano's Future After Whale Exits The whale's exit from Cardano raises questions about the future of ADA. While large investor exits can negatively impact market sentiment, Cardano remains a well-established blockchain with a strong community and development team. However, if more whales follow this trend and shift to utility-based projects, it could place downward pressure on ADA's price and hinder its long-term development. For ADA to regain momentum, the platform may need to accelerate its roadmap and introduce more innovative features that resonate with the changing demands of investors. Emphasizing partnerships, scalability, and DeFi solutions could help Cardano regain its competitive edge. Future Outlook: The Rise of RWA Projects in the Crypto Ecosystem As more whales and institutional investors seek out RWA-focused projects, the sector is likely to become a key player in the future of DeFi and blockchain technology. Rexas Finance, with its innovative approach to tokenizing real-world assets, is well-positioned to lead this charge. The rise of RWA projects offers a new frontier for investors looking to diversify their portfolios

with utility-driven tokens. As the crypto market continues to evolve, the shift toward stable, asset-backed tokens like those offered by Rexas Finance may redefine the investment landscape, providing long-term value and growth opportunities. - Bitcoin ETFs experienced a net outflow of \$287M, followed by a \$28.6M inflow on Sept. 9. - RSI at 42.21 suggests a slight bearish sentiment, with the potential for further price consolidation or decline. As of September 10, 2024, Bitcoin (BTC) is trading at \$57,027 according to CMC data, reflecting a slight pullback following recent upward movements. The cryptocurrency's 24-hour trading volume has surged by 46%, reaching \$33.83 billion, indicating heightened market activity and its market cap has increased by 3.12% to \$1.12 trillion. The U.S. spot Bitcoin ETFs have experienced notable fluctuations, with investors gradually withdrawing from the market. In recent weeks, ETFs saw a massive net outflow of \$287 million, the largest in four months coinciding with the coin's struggles to find stable support levels. Bitcoin ETFs saw a net inflow of \$28.6M on Sept. 9, ending an 8-day streak of outflows: However, some funds, like BlackRock's iShares Bitcoin Trust, still show strong long-term performance, maintaining positive momentum since its launch while Bitcoin faces resistance, Bitcoin ETFs remain in focus. BlackRock and Fidelity have led substantial inflows in prior months, but market sentiment has become mixed due to recent outflows. If market confidence in ETFs rebounds, we could see a new wave of institutional participation, positively impacting Bitcoin prices. Additionally, any regulatory developments surrounding Bitcoin ETF approvals could serve as short-term catalysts for price movements. Bitcoin at a Critical Juncture Bitcoin is facing significant resistance at \$59,381. If this level is broken, the next target would be the second resistance level at \$61,076. The price is hovering near a critical juncture. If it can successfully breach the \$59,381 resistance level, we might witness another rally towards \$61,076. However, if Bitcoin fails to break above the \$59,381 resistance, it could test the support level of \$53,933. This support is a safety net for bulls, providing a potential rebound zone if bearish pressure intensifies. The RSI currently stands at 42.21, indicating that the coin is neither overbought nor oversold territory. However, this value shows a slight leaning toward bearish sentiment, suggesting that the recent drop in the coin's price might extend if the RSI continues trending downwards. While a rebound might indicate consolidation before another price surge. Highlighted Crypto News Today Whale Activity Impacts Solana Price With A \$4M Purchase

- Pump.fun has warned US users to avoid using the platform for the next 48 hours. - Pump.fun's warning is speculated to be due to potential regulatory actions. Pump.fun, a Solana-based marketplace for creating and distributing custom tokens, primarily memecoins, has made headlines with a peculiar warning to U.S. users. On September 10, the platform took to Twitter to issue a public service announcement: "PSA: If you are a sensitive American, please avoid visiting Pump.fun in the next 48 hours." PSA: If you're a sensitive American, please avoid visiting pump.fun over the coming 48 hours. There is a storm brewing. "pump.fun (pumpdotfun) September 9, 2024 The platform's alert hints at potential regulatory scrutiny that could impact how US users access the site. Although specific details about these regulatory actions are not yet available. But the access restrictions in the United States suggest that significant changes might be on the horizon. This sudden warning comes as the platform continues to gain attention for allowing users to mint and trade their own tokens. Known for its focus on memecoins and community-driven projects, Pump.fun has attracted both enthusiasts and skeptics in the crypto space. Latest Updates from Pump.fun Since its launch in January, the platform has gained popularity for its memecoin launchpad. Recently, it has achieved a milestone by generating \$100 million in revenue from over one million memecoins. According to Dune Analytics, the platform has created 6,956 new tokens for the Solana blockchain in just the past 24 hours. To date, the platform has launched a total of 1,976,385 tokens. Among the notable memecoins currently active on Pump.fun is Dogwifhat (WIF), which has seen a rise of 11% to reach \$1.68. Over the past week, WIF has surged by more than 5.71%. Another popular token, BOOK OF MEME (BOME), has experienced a 5% increase in trading at \$0.006388. More recently, Solana project accelerator Orbitt has announced that its market-making service now supports Pump.fun. This new integration, introduced on September 6, will help Pump.fun projects attract more volume and sustain their growth. Orbitt's market-making service, known as Orbitt MM, is designed to boost trading volume and visibility for Pump.fun token launches. Highlighted Crypto News Today FBI Reports Record \$5.6B in Losses from Crypto Scams in 2023

- Josip Heit has reached a settlement with regulators from five states in the US. - After reporting losses in 2023, GSB reportedly prevented certain investors from cashing out. U.S. officials have reached a settlement with GSB Group head Josip Heit over an alleged \$1 billion illicit cryptocurrency scam. The five states took this action in an effort to recoup investment funds totaling millions of dollars. To safeguard financial markets, U.S. regulators have reached a settlement with Josip Heit, the head of the GSB Group, over an alleged \$1 billion illicit cryptocurrency scam. The settlement involves five states: Arizona, Texas, Alabama, Georgia, and Kansas, where Heit's crypto efforts were most active. Heit, who was reached by the Texas State Securities Board in an effort to get money back for thousands of investors in the US and Canada who were harmed. Along with other items including investments in the metaverse and a cryptocurrency that could be traded for gold, the scheme offered investors tokenized ownership in a skyscraper. Full Refund to Investors After reporting losses in October 2023, GSB reportedly prevented certain investors from cashing out. Joe Rotunda, the director of the Texas regulator, recently told Bloomberg that customers in states that are taking part would get all of their money back. The Director stated: "We have negotiated a settlement that will ensure that all clients in any state or province that join the settlement receive 100% of their deposits, less any withdrawals. This is really a North American settlement. We don't often have the opportunity to get pure financial relief on a broad scale. This is rare." In an effort to safeguard investors, authorities are maintaining their stringent market controls. Hackers from North Korea have recently threatened Bitcoin ETF issuers, according to the FBI. In the past, when cryptocurrency schemes have failed, it has impacted market sentiment and asset values. Which in turn rely on the platform's reach. Highlighted Crypto News Today:

- With a total of \$6.2M, Solana had the highest influx of any asset, while Ether lost \$98 million. - Markets are already bracing for Tuesday's CPI inflation data. The latest data from CoinShares shows that cryptocurrency investment products had another rough week, with \$726 million leaving the market. Crypto investment products have seen the biggest outflow observed since March 2024, according to CoinShares' head of research James Butterfill's latest "Digital Asset Fund Flows Weekly Report" published on September 9. This follows prior recurrent weekly outflows. Pessimistic Outlook The week of March 17-23, as previously reported by CoinShares, experienced unprecedented weekly withdrawals of crypto products, with a total loss of \$942 million. Last week saw \$643 million leave crypto investment products based on Bitcoin. With a total of \$6.2 million, Solana had the highest influx of any asset, while Ethereum lost \$98 million. Consistent with the pessimistic outlook prompted by last week's stronger-than-expected U.S. macroeconomic data, which boosted the probability of a 25-basis-point (bp) interest rate drop, selling pressure has persisted. When the US employment statistics came out negative, the market paused its daily outflows in expectation that the US Federal Reserve will choose to lower interest rates by 50 basis points. Markets are already bracing for Tuesday's CPI inflation data; a 50 bp drop is more probable if inflation falls short of forecasts. Experts say that risk-on assets like Bitcoin had its "moment of truth" with the latest US job market figures. Assets with a high degree of uncertainty, such as risk-on investments, have benefited from a rise in investor demand whenever borrowing rates have fallen. Several prominent Bitcoin mining businesses, like CleanSpark (24% fall), closed the week with double-digit declines, according to CNBC. Highlighted Crypto News Today:

Crypto Staking has become one of the most popular ways to earn a passive income by investing in cryptocurrencies. With the evolving nature of cryptocurrencies, CryptoHeap has gained a greater place in the market values and the investors have the opportunity to gain higher rewards. This article will provide you with information on the rewards awarded by CryptoHeap and the cryptocurrencies that give higher returns through CryptoHeap. Understanding Staking and Benefits Before moving into the various cryptocurrencies it is important to get an idea about what is meant by staking. The staking process is known as the process of locking some amount of cryptocurrencies in a digital wallet and participating in a blockchain network. By securing your cryptocurrencies in a network you will receive rewards in return, which is usually paid as the cryptocurrency that you have staked. The major importance of cryptocurrency staking is the ability to earn a passive income. You can invest your cryptocurrencies in a safe platform and grow your assets with time because staking is an energy-friendly process and has earned the trust of more people worldwide. Staking Cryptocurrencies on CryptoHeap There are widely available staking plans available on various platforms and among them, CryptoHeap is considered one of the famous platforms due to the variations in the plans available in it. Also, CryptoHeap provides competitive APY and a user-friendly appearance which allows users to easily start staking with CryptoHeap. CryptoHeap provides a chance to stake with various cryptocurrencies for staking which has different rates and the different minimum amounts to start staking. In this way, CryptoHeap offers a great platform for users to get maximum returns with all the relevant pieces of information. Top Cryptocurrencies for Staking with High Rewards 1. Ethereum (ETH) One of the most famous cryptocurrencies available on CryptoHeap is Ethereum. Staking with Ethereum is very popular among investors even if the Ethereum transitions into Ethereum 2.0. The general range of Annual Percentage Yield is from 5% to 7% in Ethereum when staking with CryptoHeap. The rewards paid by CryptoHeap are also in ETH which makes it favorable for long-term holders. 2. Cardano (ADA) Another famous cryptocurrency in the market that is readily used in staking is Cardano. It offers Annual Percentage Yield of 4-6%. The PoS system of Cardano is efficient and offers rewards on time. This can make influence investors to stake with Cardano. 3. Solana (SOL) Solana is the most demanding cryptocurrency in the digital market because of its ultra-fast transaction speeds. It offers an Annual Percentage Yield of 6-8% when staking with CryptoHeap. 4. Tezos (XTZ) Tezos is also a famous cryptocurrency used in staking. There is a specialty in Tezos, it can be delegated to validators without locking up their tokens. It offers an Annual Percentage Yield of 5-7 % when staking with CryptoHeap. Steps to Start Staking on CryptoHeap - Sign up: Get started on CryptoHeap.com. You will get a \$100 sign-up bonus! - Deposit: Transfer the crypto you want to stake into your CryptoHeap wallet - Choose a Staking Plan: Go to the staking section and pick a plan. Each plan has different rewards and lock-up periods - Select: Once you select a plan a guide will appear to help you decide which one is best for you with other advice - Check Your Crypto Staking Rewards: Check the staking dashboard regularly Generating Passive Income with Crypto Staking Factors Affecting Staking Rewards The above-mentioned cryptocurrencies are indeed able to achieve high rewards and a higher APY on CryptoHeap, however, there are several factors that can affect the rewards users receive. Network activity and volatility are the most influential factors. Inflation Rate: The inflation is affected by the rewards awarded by the staking because most of the network increases the supply to pay staking rewards. -Validator Performance: The validator's performance directly affects the staking rewards and if the performance is poor, it can cause lesser rewards. " Lock-up Periods: The lock-up period may differ according to the staking plan. Therefore if the lock-up period is high the rewards may also be high, and the liquidity decreases due to this. How to Choose the Best Staking Option on CryptoHeap The staking plan can be selected according to the desire of the CryptoHeap. But it is important to consider about following factors: " APY: You can select the best staking plan by considering the APY offered by the platform. Since CryptoHeap gives you the chance to start with different cryptocurrencies, you have the chance to select the best plan according to your wish. " Risk Tolerance: If there is a greater association with staking, the rewards can also be high. Therefore it is important to look at the volatility of cryptocurrencies when staking. " Staking Terms: There are different terms and conditions applied for each staking plan. Therefore it is important to consider the staking period, withdrawal terms, and conditions applied for withdrawals. Conclusion Crypto Staking is one of the best ways to earn a passive income because it provides a chance to increase the assets of the users easily. There are widely used cryptocurrencies in the market such as Ethereum, Solana, and Cardano. The income you gain through Crypto Staking should be carefully managed because several factors can affect the network activity such as the inflation rate, and the performance of the validators. The crypto market never fails to amaze, with new digital currencies and projects popping daily. These new players aim to attract investors by offering brand new features or addressing specific market needs. Recently, three crypto have gained significant attention within the digital currency community: Artemis Coin, Pepe Coin, and Shiba Inu. Each of these digital currencies presents its own unique value proposition to potential investors and users. However, Artemis Coin has attracted investors by solely focusing on decentralised commerce. This approach potentially

positions Artemis Coin as an important development in the application of blockchain technology to online transactions. Artemis Coin: Revolutionising Crypto Commerce Artemis Coin (ARTMS) aims to create a decentralised marketplace that challenges the scope and functionality of e-commerce, along with the incorporation of blockchain technology. At the centre of Artemis lies its multi-chain support that helps to conduct transactions across various blockchain networks including Ethereum, Solana, BNB, TRON, Avalanche, and Cronos. What sets Artemis apart is its diverse offering. The platform isn't just limited to retail products; it extends to professional services as well. Imagine a world where you can not only purchase goods using crypto but also book a doctor's appointment or hire a freelance graphic designer, all within the same ecosystem. This comprehensive approach to decentralised commerce is what makes Artemis a potential frontrunner in the next generation of crypto projects.

Smart contracts are at the core of the platform. This not only protects buyers and sellers but also builds trust within the community. Total Supply: 100,000,000,000 ARTMS Presale: 15% Marketing: 25% Project Funds: 25% Rewards: 15% Liquidity: 10% Staking: 10% This balanced allocation ensures a focus on project development and marketing while providing ample opportunities for community engagement through rewards and staking. It's a tokenomics model designed for long-term value creation and sustainability. Pepe Coin Pepe Coin takes a different approach, drawing inspiration from popular internet memes. It has quickly gained popularity, especially among younger users who are familiar with online trends. Pepe Coin's main strength is its active community of supporters. While it may not offer the same practical uses as Artemis, its rapid growth has made it a notable player in the cryptocurrency market. Shiba Inu Shiba Inu is often compared to Dogecoin, another popular cryptocurrency. Like Pepe Coin, Shiba Inu relies heavily on its community of supporters. It has expanded to include its own trading platform and a marketplace for digital art. While Shiba Inu has seen significant growth and has many supporters, it faces the challenge of maintaining its popularity and finding long-term practical uses. Looking Ahead Each of these projects brings something different to the cryptocurrency market. Pepe Coin and Shiba Inu demonstrate how online communities can drive interest in digital currencies. Artemis Coin, with its focus on creating a practical digital marketplace, aims to address specific needs in online commerce. Artemis's goal of creating a comprehensive digital marketplace could potentially fill a gap in the current market. As the crypto presale project moves towards its full launch, many people interested in cryptocurrencies are paying close attention. In the rapidly changing world of digital currencies, Artemis Coin, Pepe Coin, and Shiba Inu represent different aspects of cryptocurrency development. While currencies based on internet trends have shown impressive growth, projects like Artemis that focus on practical uses may be important for the wider adoption of cryptocurrencies. For those interested in new developments in digital currency, Artemis Coin's initial sale offers an opportunity to invest early in a project aimed at reshaping digital commerce. For more information about Artemis Project: - Website: <https://artemiscoin.co> - Twitter: <https://x.com/CoinArtemis> - Telegram: <https://t.me/coinartemis> Disclaimer: TheNewsCrypto does not endorse any content on this page. - Bitcoin trades near \$54,000, with significant support at \$53,000 and \$51,500. - RSI indicates moderate buying pressure, signalling room for growth. Bitcoin is trading around the \$54,000 mark, showing strong market dynamics as it hovers near significant support levels. Bitcoin price declined by 4.09% in the last 24 hours. Over the last few days, BTC's performance has indicated a mixed sentiment, with both bullish and bearish factors in play. Bitcoin's previous rally was supported by positive sentiment in the broader crypto market, particularly after the SEC's decision to delay certain Bitcoin ETF rulings. Additionally, continued institutional interest in Bitcoin has strengthened its position above \$50,000. Investors are also keeping an eye on global macroeconomic conditions, as inflation concerns and potential Federal Reserve actions could impact Bitcoin's trajectory. For traders, the \$54,000 level remains the key to watch. A clean break above this level with strong volume could signal the next leg of Bitcoin's rally toward \$57,000. However, traders should be cautious of a potential pullback if the price fails to maintain momentum above this critical resistance point. Bitcoin In Today's Market Bitcoin faces significant resistance at \$54,000 and \$55,000. If the price can break and hold above \$54,000, it could open the door for further gains toward \$57,000 in the medium term. On the downside, immediate support is found at \$53,000, with stronger support around \$51,500. A break below \$51,500 could shift the sentiment to bearish and push the price back toward \$48,500. The RSI is hovering around the 55-60 range, indicating moderate buying pressure but no overbought conditions. This means that while Bitcoin has room to grow, it's not yet in a frenzy of buying activity, leaving the potential for further gains if buying pressure increases. Trading Volume has been relatively steady with small spikes occurring during the \$54,000 declines, indicating that traders are not yet exhausted but are keeping their influence in check. If buying volume increases near the \$54,000 level, it could push Bitcoin towards breaking its current resistance. If bulls manage to push BTC past the \$56,000 resistance, we could see a run toward \$58,000 or even higher levels, provided buying volume increases. Conversely, a break below \$52,000 might trigger a retracement toward \$50,000 or the next major support level. Highlighted Crypto News Today Sonic SVM Launches HyperFuse Nodes Sale, First Node Sale in Solana Ecosystem

- Shareholders will be able to sell their EFUT shares until September 16, 2024. - The ETF will be delisted and trading will cease after this date. Ethereum ETF Futures (EFUT) will be discontinued and liquidated by the prominent investment management company VanEck. The price of ETH, which was already experiencing a period of erratic trading due to a general market decline, has taken a huge hit. Among the many factors given by the ETF provider for the decision are declining market interest and performance issues. Recent news indicates that VanEck's Ethereum Futures ETF, traded on the CBOE, would be liquidated and closed. The decision was made after a thorough evaluation of the company's products and services. With an emphasis on liquidity, performance, and investor demand as a whole. The ETF issuer has decided to wind down the fund since, in their opinion, the EFUT has not lived up to their expectations. Dwindling Interest and Trade Activity At the same time, the company has informed shareholders that they will be able to sell their EFUT shares on the CBOE market until September 16, 2024. The ETF will be delisted and trading will cease after this date. Nevertheless, beyond this date, on September 23, 2024, every shareholder who still owns shares will get a payout from the liquidation based on their net asset value. Furthermore, the decision underscores larger worries about the market attitude towards Ethereum futures. Particularly in light of dwindling interest and trade activity. The company noted that the Ether ETF's performance has been affected by low investor demand and continued market issues. But after getting its US Spot Ethereum ETF approved, VanEck is also trying to streamline its strategic portfolio, which is why it made its latest choice. This action is in line with the firm's previous decision to phase down its Bitcoin Futures ETF. After its US Spot Bitcoin ETF was approved in January, indicating a clear intention to focus on spot market products. Highlighted Crypto News Today:

- Helium marked a spike above 2%, trading at \$8.32. - Helium Mobile saw its subscriber count surpass 100,000 in early August. Despite the growing negative trend in the crypto market, Helium (HNT) has defied all odds and topped the gainers list. In this ongoing bearish trend, HNT displayed a price surge over the last 24 hours by 2.52% and outperformed major cryptocurrencies including Bitcoin (BTC), Ethereum (ETH), and Solana (SOL). The price of HNT moved from \$7.93 to a recent high of \$8.50, with the upward momentum continuing within the past 24 hours. In the afternoon hours, the altcoin traded at \$8.32. According to CMC data, the HNT's daily trading volume showed a 15.27% increase to \$38 million. On the other hand, HIP 124 introduces a protocol for Helium to actively engage in governance within the IoT network. It likely aims to increase IoT participation within the IoT Network. Whereas, the proposal has passed with 95.26% of votes in favor. Meanwhile, the implementation will begin once the ongoing protocol work on the IoT Network, including the on-chain Organizationally Unique Identifiers (OUI) outlined in HIP 116, is completed. The full implementation of HIP 124 is estimated to take 5-8 weeks. Helium's bullish trend accompanies the growth in its mobile subscriber base. Helium Mobile saw its subscriber count surpass 100,000 in early August, reaching 112,709 till date. Can HNT Breakout Further to Sustain the Momentum? Helium has shown remarkable momentum in the last month, with an increase of 65.15%. The asset started trading at \$4.98, gradually climbing to \$7.91. Over the past seven days, the asset continued its bull run, by soaring 17.75%. The week opened trading at \$7.01, eventually reaching a high of \$7.83. The technical indicators of HNT reveal the position of daily RSI at 64.10, entering into the overbought zone. Moreover, the asset's 24-hour frame shows bullish momentum as the short-term 9-day and long-term 21-day moving averages are below the current price of \$8.15 and \$7.74, respectively. Assuming HNT's revival at \$8.39, initial resistance could be at \$8.48, and if the bullish sentiment sustains, the price will go high. Conversely, a strong bearish trajectory of Helium could take the price to the immediate support near \$8.14. Disclaimer: The opinion expressed in this chart is solely the author's. - SunPump boosts TRON non-stablecoin activity but faces steep decline. - Solana's Pump.fun reclaims lead as Sun.pump metrics fall sharply. For much of 2024, nearly 98% of activity on the TRON network was attributed to stablecoins. However, since the release of Sun.pump on August 9, this has shifted drastically. Sun.pump, a TRON-based Pump.fun alternative, has triggered a surge in non-stablecoin activity. According to Crypto Quant, stablecoins account for only 75% of token transfers, down from 98% the previous month. Sun.pump drives #TRON Network's non-stablecoin activity to new highs. CryptoQuant.com (@cryptoquant_com) September 6, 2024 "Throughout 2024 around 98% of the activity on the TRON network could be attributed to Stablecoins. This trend has had a major shift since the release of Sun.pump on August 9th. SunPump is a TRON-based meme coin factory Pump.fun has regained a statistical lead over Sun.pump, just two weeks after the TRON launchpad briefly surpassed it. On August 21, Sun.pump created 1,658 more tokens than Pump.fun in a 24-hour period. However, Dune data shows a steep fall, with Sun.pump creating only 1,258 tokens on Wednesday, marking an 83% drop from its 7,531-token peak. Solana Platform Takes Lead This decline extends to the number of daily active swappers on Sun.pump, which plummeted from 29,099 on August 21 to 6,816 on Wednesday, a 76.5% decrease. While Pump.fun hasn't seen a surge in token creation, Sun.pump's rapid decline has allowed the Solana platform to retake its lead. During Sun.pump's peak, Pump.fun launched 6,941 tokens. With Sun.pump's activity hitting lows unseen since its first week, TRON founder Justin Sun hinted at a new phase for the network, announcing that a celebrity season is coming. Earlier this year, Solana's Pump.fun hosted several celebrity meme coin launches, including tokens for Caitlyn Jenner and rapper Lil Pump. Meanwhile, TRON's native token, TRX, had a bearish week, falling 7%, though its trading volume rose by 7%. The rapid evolution in the financial world has brought many into the world of digital currencies, but confusion often occurs with cryptocurrency and Bitcoin. One would easily ask, are they the same thing? Simply, the answer is no. Though Bitcoin is a kind of cryptocurrency, that does not make it the same thing as such. It is a broad category of digital assets, whereas Bitcoin is just an asset. Let's delve a bit deeper into that, as well as into some of the opportunities presented by CryptoBox in staking and earning rewards with digital assets. What is Cryptocurrency? Cryptocurrency is a digital or virtual form of currency that uses cryptography for security. Unlike traditional government-issued currencies, cryptocurrencies operate on decentralized networks, usually based on blockchain technology. This enables transparency, security, and immutability of transactions across different networks. The world of cryptocurrency has so much more to offer than just Bitcoin. It comes with thousands of altcoins, including Ethereum, Polkadot, Solana, and many others. Each one of them has different purposes for the given networks. For example, Ethereum allows for smart contracts and decentralized applications, while Polkadot focuses on interoperability between blockchains. CryptoBox is among the leading crypto staking platforms in the world, and it comes with support for a wide variety of digital assets to stake. From staking Bitcoin and Ethereum to any of their altcoin counterparts, CryptoBox brings AI-powered solutions in optimizing staking strategies for maximum returns. How Does Bitcoin Fit Into the Picture? Bitcoin is a cryptocurrency invented by Satoshi Nakamoto, an anonymous person or group, in 2009. It was meant to serve as a digital currency that could be used to conduct decentralized transactions without the use of middlemen, such as banks. Bitcoin is often referred to as a digital gold due to its capped supply of 21 million coins and its ability to store value. But Bitcoin is by no means a lonely actor in the extended cryptocurrency ecosystem. Although it has stayed the most renowned and most valuable digital asset up to date, many have created alt-cryptocurrencies that offer everything from different functionalities to different use cases. On CryptoBox, you can stake not only Bitcoin but also a range of other cryptocurrencies such as Ethereum, Solana, Polkadot, and many more. CryptoBox uses AI-powered insights to maximize returns across diversified digital assets without compromising on the security of your crypto assets. Why Choose CryptoBox for Staking? The world of cryptocurrency can be complex, especially the concept of generating passive income through crypto staking. CryptoBox tries to make things a little easier by offering AI-enhanced liquidity crypto staking that helps you stake your digital assets while optimizing returns in the

process. The platform targets both the newbie in the field and the seasoned crypto user. Equipped with real-time market analysis, automated trading strategies, and 24/7 support, CryptoBox ensures the attainment of the highest returns possible at minimal risks. CryptoBox also pays attention to security, deploying state-of-the-art security measures to safeguard your funds. These measures include but are not limited to 2FA security, advanced encryption, and regular security audits by industry leaders like McAfee. CryptoBox also ensures staking returns at lucrative percentages. You can stake Bitcoin, Ethereum, or even other cryptocurrencies with CryptoBox and get daily profits, all with the advantage of automated strategies with the current market conditions. For example, Bitcoin staking on CryptoBox allows you to earn up to \$95.94 daily and \$101.4 referral rewards with a \$7,800 investment for 35 days. Thereâ€™s also Bitcoin pro staking where you earn \$6,200 and \$9,000 in referral rewards with a \$200,000 investment for 56 days. How to Get Started with CryptoBox It is pretty easy to stake on CryptoBox. Hereâ€™s a step-by-step guide that will get you up and running with staking on CryptoBox: Join CryptoBox: Simply sign up using your email, username, strong password, and referral code if you have one. Choose Your Staking Plan: Once your account is set up, check through the wide variety of staking plans offered by CryptoBox and choose the one that suits you well. Start Earning Rewards: As soon as you choose a plan, your assets will be staked, and you will start earning rewards right away. You can withdraw your profit at any time or reinvest it for compounding. Conclusion Although Bitcoin and cryptocurrency are two words that are used interchangeably, they donâ€™t exactly mean the same. Bitcoin is one kind of cryptocurrency, while there are hundreds of variations, all for different purposes with their own set of advantages. If someone wants to leverage the power of digital assets, then staking CryptoBox is an excellent avenue for passive income through AI-optimized strategies. CryptoBox makes the staking process easy and profitable for everyone, with security and automated solutions for maximum return. Join CryptoBox today and start earning your rewards. - Almost two years have passed since Ethereumâ€™s upgrade, The Merge. - The current price of ETH/BTC is 0.0425, the lowest level since April 2021. Analysts claim that since the â€œmergeâ€ to proof-of-stake on the Ethereum blockchain occurred about two years ago, Etherâ€™s performance has lagged behind bitcoinâ€™s by a margin of up to 44%. Almost two years have passed since Ethereumâ€™s upgrade, The Merge, which transitioned to a proof-of-stake network, and next week will observe that anniversary. Analysts from CryptoQuant found that Ethereum has lagged behind bitcoin by 44% since then. Despite the approval of Ethereum spot exchange-traded funds (ETFs) in the US on July 23, the experts noted that ether has still lagged behind bitcoin. The current price of ETH/BTC is 0.0425, the lowest level since April 2021. Further Decline on the Cards According to analysts at CryptoQuant, etherâ€™s underperformance since moving to proof-of-stake is not limited to Bitcoin. Altcoins such as Solana and BNB have outperformed Ethereum after the merge, with a 53% decline and an 18% decline, respectively, according to CryptoQuant head of Research Julio Moreno. Analysts also warned that etherâ€™s value compared to bitcoin might fall much more. Ether is still above the undervaluation zone, therefore it has room to decline in relation to bitcoin. They said that in order for ether to reach the undervaluation zone, its relative value to bitcoin would have to drop to about 0.02â€”a 50% decline. According to CryptoQuantâ€™s analysts, a decrease in network activity dynamics could be a major factor contributing to the underperformance. According to what they indicated, Ethereumâ€™s poor performance is linked to less robust network activity patterns when contrasted with bitcoin. One of the lowest points since July 2020 has been reached by Ethereum in relation to Bitcoinâ€™s transaction count. Highlighted Crypto News Today: Cardano Analyst Predicts Potential 1,000% Rally for ADA Against Bitcoin

- Binance Coin (BNB) has fallen below \$500, with its price dropping from a high of \$537 to a low of \$496. - Activity on the BNB Chain has sharply declined, including a 75.8% drop in DEX volumes. As the global crypto market faces a downturn with Bitcoin (BTC) slipping to the \$55K zone, Binanceâ€™s native cryptocurrency, BNB, is not immune to the turmoil. According to CMC data, BNB has fallen over 7.64% in the past 24 hours, dipping from a high of \$537 to a low of \$496. At the time of writing, BNB is priced at \$501.90 with a market cap of \$73.24 billion, holding the 4th position in the market. Despite the price drop, BNBâ€™s daily trading volume has increased by over 14%, reaching \$1.73 billion. However, this uptick in trading volume does not fully offset the decline in price. BNBâ€™s value has decreased substantially from its recent peak of \$598.80 on August 23, reflecting a 17.12% drop by September 4. Further, this drop in BNBâ€™s price reflects a broader decline in activity on the BNB Chain, which may be causing the lower price. Investors are cautious as BNB struggles to reach mid-June highs. Additionally, decentralized exchange (DEX) volumes on the BNB Chain have fallen by 75.8% in the week leading up to September 3, putting it behind competitors like Solana and Ethereum. Looking ahead, BNB faces challenges with decreasing future open interest and negative funding rates, indicating further declines. Technical Analysis of Binance Coin (BNB) According to the daily price chart, BNB is currently showing bearish signals. The recent crossover of the 9-day moving average below the 21-day moving average indicates that the cryptocurrency has been in a bearish trend over the past 9 days. Additionally, the Relative Strength Index (RSI) reading of 29 suggests that BNB is approaching oversold conditions. An RSI value below 30 typically signals that an asset is oversold and may be due for a rebound, but it can also indicate continued bearish momentum if the downtrend persists. In that case, if BNB fails to break above the \$550 mark, it could face further declines, potentially dropping to \$480 and possibly even reaching as low as \$465 or below \$450. Overall, BNBâ€™s current market behavior and technical indicators suggest a challenging month ahead, with significant risks if the bearish trend continues. Highlighted crypto News Today Swiss Bank Zurich Cantonal Launches Bitcoin and Ethereum Trading

- Ethereumâ€™s price has dropped nearly \$1,000 since July 30th, with the RSI indicating it is in oversold territory. - Significant sell-offs and ETF outflows are contributing to Ethereumâ€™s current bearish trend. Ethereum has been experiencing a bearish momentum since the 30th of July. It declined drastically from \$3,361 to \$2,398. This is approximately a \$1000 difference. At the time of writing, ETH is trading at 2,398 a 2.50% decrease in the past week. The 24-hour volume stands at \$15,518,482,552 billion, reflecting a 38.94% increase. Considering the one-month data, the price of Ethereum was highest on 24th August trading at \$2,814 with a \$13.70B volume. The market cap is standing at \$288.99B as of 4th September. The global crypto market cap is down 3.38% over the last day at \$1.99T indicating a bearish momentum. Besides this, the community sentiment is 79% Bullish and 21% Bearish. The total ETH holders is 126.96M which has increased 3.3% in 3 months. The Relative Strength Index (RSI) is at 36.95, suggesting that the Ethereum market is overbought, yet not back into the selling territory. If the price stays above \$2,350 the crypto market can anticipate a bullish momentum. If Ethereum fails to stay above \$2,300, a return to \$2,100 could be possible. The recent graph is reaching the previous support level of \$2,342. Few Factors Impacting ETH Price According to Spotonchain, the wazirX exploiter transferred 2,600 Ethereum worth 6.54 million from the wazirX exploiter to Tornado Cash last day. In addition, according to Whaler Talk, 80,000 Ethereum worth 192M has been moved from Binance to Arbitrum. And 8,300 Ethereum worth \$19.7M was transferred from Ceffu to Ceffu: Binance Deposit 2 hours ago. A lot of Ethereum sell-offs are taking place recently. The US Spot ETF is experiencing a major dread with a daily total netflow of \$47.40M outflows. Fidelityâ€™s FETH is the only ETH with a \$4.91M inflow. Grayscaleâ€™s ETHE has recorded \$52.31 million outflows. All the other exchanges showed zero net flows. Spot Ethereum ETFs have experienced \$476 million in outflows since they launched. - 21Shares launches 21BTC, a Bitcoin wrapper on Ethereum. - 21BTC simplifies cross-chain transactions for Ethereum-based DeFi. 21Shares has officially launched 21BTC, a new Bitcoin wrapper on the Ethereum network. This product allows users to access Bitcoinâ€™s value while utilizing the diverse functionalities of Ethereumâ€™s decentralized finance (DeFi) ecosystem. By introducing 21BTC, 21Shares aims to bridge the gap between the two most dominant cryptocurrencies, offering a unique blend of Bitcoinâ€™s stability and Ethereumâ€™s smart contract capabilities. The 21BTC token is fully backed by Bitcoin, ensuring that each token corresponds to an actual Bitcoin held in reserve. This backing provides users with the confidence that their 21BTC tokens maintain their intrinsic value, directly reflecting the performance of the underlying Bitcoin. Such an approach also addresses the common concerns surrounding the security and reliability of wrapped assets, making 21BTC a secure option for those looking to integrate Bitcoin into Ethereumâ€™s ecosystem. 21Shares Enhances Bitcoin Liquidity on Ethereum The launch of 21BTC is part of a broader strategy to enhance the liquidity of Bitcoin within the Ethereum network. 21Shares is enabling Bitcoin to be used on Ethereum, providing users with a versatile tool. This allows them to engage in Ethereum-based financial products such as lending, borrowing, and trading. The increased liquidity is expected to drive greater innovation within the DeFi space. Consequently, developers and users can now more easily incorporate Bitcoin into their Ethereum-based applications. In May 2024, 21Shares introduced 21BTC on Solana, offering users native Bitcoin access on the Solana network. This move enhances cross-chain compatibility, liquidity, and utility. Furthermore, 21BTC opens up new opportunities for investors and institutions looking to diversify their cryptocurrency holdings. The token simplifies the process of using Bitcoin within Ethereumâ€™s ecosystem, eliminating the need for complex cross-chain transactions. Moreover, this ease of use is likely to attract more participants to the Ethereum network, further driving the adoption of DeFi and other blockchain-based financial services. By combining the best features of Bitcoin and Ethereum, 21Shares is positioning itself at the forefront of this rapidly changing landscape. - Justin Sunâ€™s SunPump burned \$8.24 million worth of SUN tokens using a method called buyback and burn. - SunPump has switched to a 100% on-chain buyback and burn process, replacing the old LP token burning method. On September 4, Justin Sun, the founder of Tron, announced on X that SunPump has burned over \$8 million worth of SUN tokens from its supply, with an additional \$4 million set to be burned soon. In the last 24 hours, over 28,999,138.3071 SUN tokens valued at \$819K have been burned. Currently, SunSwap on-chain data indicates that over 10.97 million SUN tokens, valued at approximately \$3,116.12, remain to be burned. In total, more than 294 million SUN tokens have already been burned, equating to around \$8.35 million. In a recent shift, the SunPump community decided to replace the previous method of burning LP (liquidity pool) tokens with a new approachâ€”100% on-chain buyback and burn. This change, made on September 3, was driven by the communityâ€™s difficulties in understanding LP token burning, which led to some confusion. Burning records are updated in real time on the official website, giving transparency to the process. SunPumpâ€™s Latest Update SunPump, the first Tron-based meme coin generator, recently outperformed its Solana-based rival, Pump.fun, in daily revenue by over \$200,000. This is particularly notable as SunPump was launched on August 9. As per the current update, SunPumpâ€™s smart contract will continuously use 0.05% of each transactionâ€™s value on SunSwap V2 to purchase SUN tokens, which are then burned by depositing them into a designated address every four weeks. This address is linked to the TRON blackhole, ensuring the tokens are permanently removed from circulation. Justin Sun also mentioned on X that the revenue buyback and burn process is expected to be completed within a few days. Despite recent positive news surrounding the SunPump meme coin, the SUN token has experienced a notable decline. Over the past 24 hours, the SUN tokenâ€™s price has dropped by over 14.5%, currently trading at \$0.02871. The market cap of SUN stands at approximately \$285 million. Highlighted Crypto News Today

- The official X accounts of the family members of Donald Trump fell victim to the hack. - World Liberty Financial to be built on the DeFi platform Aave and the Ethereum blockchain. Hackers gained access to the X accounts of Trumpâ€™s family members, Lara and Tiffany Trump, using them to disseminate a fake announcement regarding a token of the crypto project, World Liberty Financial. Eric Trump quickly took to X to denounce the fraudulent announcement, warning that the posts were scams. Further added that the addresses provided were not legitimate. The official X handle of World Liberty Financial also warned the community. ALERT: Laraâ€™s and Tiffany Trumpâ€™s X accounts have been hacked. Do NOT click on any links or purchase any tokens shared from their profiles. We're actively working to fix this, but please stay vigilant and avoid scams! â€” WLF (WorldLibertyFin) September 4, 2024 Hacker on Lara Trumpâ€™s X post stated, â€œour goal at World Liberty â€” is to utilize our governance token on Solana, \$WL, to support our DeFi lending protocol.â€ Confirmed Details of Trump-Linked Crypto Project Notably, the posts inferred the World Liberty Financial, a crypto project endorsed by the Trump family. The project has yet to launch formally. Donald Trump has called himself the â€œcrypto presidentâ€ and whose election campaign is acquiring immense attention and substantial contributions from the industry. This upcoming project has itself been the target of scammers ahead of its launch. The cybercriminals have drawn tens of thousands of users to a counterfeit version of the site. The official Telegram channel of World Liberty Financial warned against the fake channel. Also, it changed the bio of its account on X to determine scams, fake tokens, and airdrop offers to circulate. Moreover, according to the whitepaper, World Liberty Financial to be built on the decentralized financial platform Aave and the Ethereum blockchain, with a core â€œcredit account system.â€ The crypto project is likely inspired by the DeFi protocol Dough Finance. Moreover, the confirmation is pending on whether it will use its codebase. A few hours before the hack, the

information of a plan to announce a “non-transferable” governance token called WLFI unveiled. On the other hand, Dough Finance has lost \$1.8 million in digital assets due to a flash loan attack last July 12. The attacker converts the stolen USD Coin (USDC) into 608 Ether (ETH) using the Zero-Knowledge (ZK) protocol Railgun. Highlighted Crypto News Bitcoin Surrenders to Bears with Major Dips and ETF Outflows

- North Korean hackers are using fake job offers and investment opportunities to target cryptocurrency firms. - The FBI has identified over \$40 million in stolen Bitcoin linked to North Korean cyber activities. FBI has warned the digital asset firms to be aware of a North Korean Crypto hacker group. DPRK has employed fake employment offers and investment opportunities to trick crypto users into downloading malware. They have made the latest attempt to steal companies’ cryptocurrencies. On 3rd September, The Federal Bureau of Investigation released a Public Service Announcement. The alert titled, “North Korea Aggressively Targeting Crypto Industry with Well-Disguised Social Engineering Attacks” reports that the Democratic People’s Republic of Korea is doing “highly tailored and difficult-to-detect” campaigns against employees of DeFi, cryptocurrency, and other related businesses. Besides this, the North Korean hackers have researched various targets connected to cryptocurrency ETFs. They are so well versed in their job that, even those giant and superior organizations with access to large quantities of cryptocurrency-related assets can be vulnerable to DPRK’s determination. FBI has also given an overview of the DPRK’s tactics, alerting companies to take measures for those most at risk. In addition, the announcement includes mitigations, indicators, and responses. They have listed potential indicators of the North Korean social engineering activity. Few practices were mentioned to lower the risk from North Korea’s innovative and evolving social engineering capabilities. DPRK’s Previous Activities in Crypto Theft Previously, on 16th August, On-Chain Analyst ZachXBT exposed a North Korean network targeting crypto firms. He reported discovering a DPRK network employed in 25 plus crypto projects. He has stated that while exploring a particular group’s loss of money, he found several DPRK IT workers being involved in the scam. Furthermore, on 22nd August, the FBI identified cryptocurrencies being targeted and stolen by DPRK. They believed that the DPRK may attempt to cash out the Bitcoin worth more than \$40 million. After the investigation, the FBI found out the bad actors moved 1,580 Bitcoin from various high-volume crypto wallets and are holding it in several addresses. Highlighted Crypto News Today: Solana Foundation Rebutts Centralization Claims Amid Patch Controversy

- 96% of NFTs are inactive, showing low trading and social media activity. - The 2023 market saw a surge in dead NFTs, indicating high volatility. The NFT market is facing a severe crisis, with a staggering 96% now considered “dead”, according to NFT Evening’s 2024 report. This designation applies to NFTs that exhibit no trading volume, minimal sales over seven days, and almost no social media activity. The report analyzed more than 5,000 NFT collections and approximately 9 million transactions, revealing the market’s significant downturn. The financial impact on holders is equally concerning. About 43% of owners are currently experiencing losses, with an average investment decline of 45%. This is a stark contrast to the bullish sentiments of previous years. The data shows that the average lifespan of an NFT project is just 1.14 years, which is 2.5 times shorter than traditional cryptocurrency projects. This short lifecycle highlights the challenges NFTs face in retaining value over time. The Lifespan of NFTs: A Rapid Decline The year 2023 proved particularly disastrous, with nearly one-third of all NFTs being declared “dead” within that year alone. The rapid decline of these digital assets has left many investors questioning their long-term viability. For instance, once-popular collections like Pudgy Penguins have seen their values plummet, with some holders suffering losses as high as 97%. Even stalwarts like CryptoPunks have not been immune to this downturn, selling at record lows. While the market struggles, certain projects have managed to maintain some level of engagement and value. Collections like Azuki, for example, have continued to thrive due to strong community involvement and effective marketing strategies. However, these are exceptions in an otherwise bleak landscape. The market’s volatility and the rapid devaluation of assets have led to increased skepticism about the sustainability of NFTs as a viable investment. While some projects may recover, the majority seem to be on an irreversible decline. Despite the potential for NFTs to revolutionize digital ownership and royalties for artists, the current market conditions suggest that the road ahead will be challenging. Highlighted Crypto News Today Bitcoin Miner’s Struggle Soars as BTC Hashrate Hits Record High

- Bitcoin Hash rate hit a new record high of more than 742 exahashes per second (EH/s). - The high difficulty rate that comes with an increased hashrate is a major problem for profitability. On September 1, 2024, the hashrate of the Bitcoin network, which is the total computing power used to secure the Bitcoin network hit a new record high of more than 742 exahashes per second (EH/s). As expected given the ongoing trend toward application-specific integrated circuits (ASICs) and other forms of high-performance mining gear, CryptoQuant data shows that the hashrate has been gradually increasing since 2021. Cost of Mining Bitcoin Surges Since miners are compelled to improve their mining rigs, extend their operations, and consume more energy to stay competitive as the network hashrate grows, the cost of mining Bitcoin (BTC) also rises. The high difficulty rate that comes with an increased hashrate is still a major problem for miner profitability. Revenue for miners hit an all-time low of \$827.56 million in August 2024, making it the poorest month for profitability since September 2023. A recent research by JPMorgan further confirmed the miners’ financial woes, showing that they were experiencing a revenue pinch due to factors such as rising energy prices and a reduced block subsidy. Out of the five Bitcoin mining businesses examined, the report found that Riot Platforms had the highest expenditures per Bitcoin at about \$62,000 and MARA at around \$55,700. Mining businesses are exploring various strategies to increase income and stay afloat in the face of these high expenses and decreased earnings. A high debt-to-equity ratio may be disastrous for a mining company, so many are shifting their focus from issuing corporate debt to selling stock to investors. In light of declining mining profits, several mining corporations are looking to diversify their operations into high-performance computing and artificial intelligence. Highlighted Crypto News Today:

- Sun said that the new buyback and burn method, easier to verify, and avoids complications. - Binance, a cryptocurrency exchange, follows a similar strategy to SunPump. Tron founder Justin Sun has stated that the SunPump meme token community has chosen to implement a 100% onchain buyback and burn operation. The decision was reached after a community debate that shifted focus away from burning liquidity pool (LP) tokens, as stated in Sun’s post on X. The principle of burning LP tokens was first proposed since it was seen as a beneficial practice by other popular memecoins, such as Shiba Inu. According to Sun, LP token burning has many benefits. Including making the burned liquidity more “efficient” liquidity depth and “more regulator-friendly.” Put, in effect Starting Today Given the intricacies of LP token burning, Sun thinks a “better approach” might be offered. By implementing a buyback and burn mechanism that is 100% onchain. Sun said that the new buyback and burn method is “easier to verify and more straightforward.” Also, avoids complications, and would be put into effect “starting today” on Sept. 3. There will be no “need for any explanations” since all burn funds will be recorded onchain for immutable verification. Thanks to an onchain buyback and burn mechanism that is implemented immediately. Moreover, Binance, a cryptocurrency exchange, follows a similar strategy to SunPump. By repurchasing and burning its BNB token with a percentage of its revenues. As of August 21st, SunPump had more daily revenue and activity than its Solana-based predecessor, Pump.fun. According to Adam, a blockchain expert, SunPump ended the day with a bigger amount of newly minted tokens than Pump did for the same Pump.fun. In comparison to Pump.fun’s 6,701 token launches and \$366,000 revenue, SunPump had 7,351 token launches and \$585,000 in revenue over the 24 hours mentioned by Adam. Highlighted Crypto News Today: Fed Rate Cuts May Not Boost Bitcoin Prices as per Arthur Hayes

New York, NY, September 3rd, 2024, Chainwire Forgd, a token advisory and optimization platform, announced the launch of its free-to-use web platform, which provides blockchain projects unrestricted access to tools for tokenomics design, liquidity monitoring, cap table management, and financial planning. Forgd eliminates financial barriers associated with traditional Web3 Advisory and consolidates an otherwise fragmented services industry built to support blockchain projects as they issue a token. A token launch involves complex challenges, prompting many blockchain projects to hire multiple external advisors for tasks like tokenomics modeling, market maker engagement, and exchange listing. These engagements can be costly and often lead to operational inefficiencies, given that few advisors operate an end-to-end process. Forgd addresses these challenges with free software tools or executing all vital go-to-market activities and optimizing token performance post-launch. This “self-service” approach to Web3 advisory allows teams to execute at their own pace. “Many of the tasks involved in a token launch are outside the expertise of a typical tech founder, which is why we created a set of tools to streamline and simplify the process in an end-to-end application,” said Shane Molitor, CEO and Founder of Forgd. “Forgd was built in response to the recurring needs of founders we’ve observed in Web3. Our DIY software tools not only reduce costs but also allow teams to concentrate on product innovation rather than specialized capital market activities.” Shane Molitor is a 10-year cryptocurrency veteran who formerly operated as CEO of AscendEX, Head of Trading at FBG Capital, and Business Development Associate at Gemini. Forgd recently enhanced its capabilities by acquiring Tokenomics DAO, a research institution focused on tokenomics and novel protocol design. For blockchain projects that haven’t yet launched their token, Forgd helps them design tokenomics, conduct cash flow analysis & prepare for fundraising, secure partnerships with market makers & exchanges, and navigate administrative tasks such as offshore company formation. For projects with a live token, Forgd provides tools for monitoring market maker performance & token unlocks, automated token streaming, and even non-custodial liquidity provision. In a strategic move, Forgd has aligned with the Solana Foundation to provide select tools exclusively for projects built on the Solana blockchain. This collaboration underscores the Forgd commitment to supporting scalable blockchain ecosystems and fostering project growth. “We are thrilled to collaborate with the Solana Foundation to offer our tools to Solana’s vibrant developer ecosystem,” said Florian Strauf, CTO of Forgd and Founder of Tokenomics DAO. “This strategic alignment highlights our dedication to creating public goods to support blockchain entrepreneurs, and we look forward to partnering with other blockchain base layers to create comprehensive cross-chain support.” Forgd reports that over 250 projects have already benefited from using its pioneering tools, such as “AMMA”, a non-custodial market making protocol that empowers projects to act as their liquidity provider across all major exchanges with automated rebalancing. “The positive response since our private beta launch in Q1’24 has been overwhelming,” commented Shane Molitor. “Our team is motivated to continue innovating and developing new tools to empower Web3 entrepreneurs aiming to launch and scale projects of their own.” For more information about Forgd and its services, users can visit Forgd.com. About Forgd: Forgd is a token advisory and optimization platform with free software tools for blockchain founders to launch and scale their projects. Operating as a public good, Forgd is reinventing Web3 advisory by providing blockchain projects free access to specialized capital markets tools such as tokenomics modeling, liquidity monitoring, cap table management, exchange listing, and financial planning. In addition to its self-service software tools, Forgd offers tailored consulting services for teams seeking extra guidance. This approach allows Forgd to service a broad spectrum of blockchain projects ranging from DIY enthusiasts to those who prefer white-glove support, ensuring accessibility and expert assistance are readily available. www.x.com/forgd_ Contact Marketing Dan Mulligan Forgd dan@forgd.com

Trader turned \$5K into \$670K with Ethervista’s token launch. - Ethervista’s VISTA token surged 15 times in value in 24 hours. A trader identified as 0x430 achieved a notable profit by investing \$5K into Ethervista, a new Ethereum Layer-2 network. Within 48 hours of the token launch, this investor turned their initial stake into \$670K, reported prominent data aggregator platform, Arkham Intelligence. Ethervista has attracted significant attention in the Ethereum DeFi sector due to its innovative approach to liquidity management and token distribution. The platform, which launched its VISTA token recently, has been positioned as an alternative to the Solana-based PumpFun. In just the past 24 hours, Ethervista saw substantial activity, consuming over 150 ETH in gas fees, while the price of VISTA surged by 15 times its initial value. Meanwhile, according to data from Dune Analytics, the largest and third-largest VISTA holders are controlled by the same individual. This investor initially purchased 79,070 VISTA tokens for 10.5 WETH on September 1 and sold 42,100 VISTA tokens over the following two days, generating 170.39 WETH in returns. More Details On Ethervista Ethervista’s approach includes a fair launch strategy with a five-day liquidity lock to mitigate risks such as rug pulls. The platform has also implemented a fee mechanism for token swaps, with fees in ETH distributed to liquidity providers. Within five hours of launching, Ethervista generated \$25,000 in fees. The VISTA token features a deflationary model with a cap of 1 million tokens and a burn mechanism to reduce the supply. Over \$200,000 worth of VISTA tokens have been burned to date. Looking forward, Ethervista plans to introduce additional features including ETH-BTC-USDC pools, lending, and fee-less flash loans. Investors should note that the first unlock of VISTA LP tokens is scheduled for September 4. And caution is advised as the platform continues to develop. Highlighted News Of The Day Binance CEO Calls for Gambaryan’s Release Due to Inhuman Treatment

- Tron’s gas revenue jumped by 46.54% signaling strong network activity. - Ethereum Solana, and Bitcoin experienced declines in gas revenue. Tron’s gas revenue increased by 46.54% in August 2024, reaching \$61.43 million according to data from Lookonchain. This surge significantly

outpaced other major blockchain networks such as Ethereum, Solana, and Bitcoin, all of which saw declines in gas revenue during the same period. Ethereum's gas revenue fell by 33.44%, Solana's by 48.51%, and Bitcoin's by 16.85%. These drops are linked to a decrease in on-chain activity and a shift in user preferences towards more cost-effective and faster networks, like Tron and Binance Smart Chain (BSC), which saw a 6.63% increase in gas revenue. The growth in Tron's gas revenue is a clear indicator of its expanding ecosystem and rising user engagement. New projects, such as the memecoin deployer SUNPump, have contributed to this increase by boosting transaction volume on the network. Additionally, Tron's ongoing development of new applications and features is attracting more developers and users, further driving up gas fees. Tron's recent performance also includes surpassing Ethereum in total revenue, which exceeded \$435 million, a 50% advantage over Ethereum for the same period. This growth is partly due to increased Tether (USDT) settlements on the Tron network, which now handles one-third of Visa's settlement volume. This highlights Tron's growing influence in the blockchain sector, particularly in stablecoin transactions. Tron's Challenges Amidst Rising Gas Revenue Despite these gains, the network faces some challenges. While its gas revenue has increased, the network's total value locked (TVL) has shown volatility, reflecting a mixed picture of stability and growth. This fluctuation could impact the network's future growth prospects if not addressed effectively. Furthermore, Tron's native cryptocurrency, TRX, has experienced some price volatility. While Tron's gas revenue growth and strategic initiatives indicate a positive trajectory, the network must continue to innovate and manage its challenges to maintain and enhance its position in the competitive blockchain landscape. Highlighted Crypto News Today is the SEC Lagging Behind in Digital Asset Regulation?

The Bitcoin-based DeFi industry is heading for a shakeup following news that BitGo, creator of the "wrapped Bitcoin" or wBTC token that's used to represent BTC on the Ethereum blockchain, is working with new custodians in Hong Kong and Singapore. As experienced DeFi stalwarts will know, wBTC provides users with an easy way to utilize Bitcoin, the world's most popular cryptocurrency, in various DeFi protocols. It enables investors to borrow, lend and stake the asset to earn yield, just as they can do with other kinds of crypto. Since launching in 2019, wBTC has been a huge hit among investors who are keen to put their idle BTC tokens to work, earning some kind of interest rather than just sitting in their wallets doing nothing. While Bitcoin always has the potential to appreciate in value, that's not enough for some smart investors who want the ability to put their BTC to work in the same way as they do with the rest of their crypto assets. wBTC brings Bitcoin to Ethereum, the blockchain that's home to the vast majority of the crypto industry's DeFi applications, and it has proven to be hugely popular. At one point in 2021, the market capitalization of wBTC had grown to around \$16 billion, and today the total wBTC in circulation is still valued at over \$9 billion, making it a top-twenty cryptocurrency. However, the problem with wBTC is that it means having to trust the custodian, which is the coin's creator BitGo. That company recently said that it's moving away from its sole custodian model, utilizing the services of third-parties to try and provide greater trust in the asset. It said it will be working with a company called Bit Global, which is based in Hong Kong and Singapore. That company, which is run by the Tron network founder Justin Sun, will be tasked with storing the BTC that's used to mint wBTC tokens on a 1:1 basis. But rather than improving trust, the news seems to have had the opposite effect, despite BitGo CEO Mike Belshé's insistence that "there is no single party that has the ability to mint or steal from the underlying treasury". The news prompted MakerDAO, one of the most prominent DeFi platforms on Ethereum, to pass a proposal that led to it abandoning wBTC. According to the proposal, the community was worried that the new setup would result in "too much control" centered in the hands of Bit Global. While other protocols, such as Aave, continue to use wBTC, the transition has once again brought the risks of using custodians into the spotlight. wBTC Is Not The Only Game In Town Investors who are concerned about the reliance of centralized custodians do have some alternatives, for wBTC is far from the only way to utilize BTC in DeFi. In actual fact, Bitcoin DeFi has emerged as a hot topic of late, thanks to recent programmability changes in Bitcoin's underlying code that have opened the door for dozens of new projects. First, there are plenty of permissionless alternatives to wBTC, including DLC.Link's "trust-minimized" dCBTC, which uses a Taproot-based Bitcoin multisig to let institutions mint dCBTC without the need for custodians. Aki Balogh, co-founder and CEO of DLC.Link, told Blockworks that dCBTC is designed in such a way that the BTC that's used to mint the alternative token can only be returned to the same wallet address that it originally came from. "It's literally a theft-proof protocol," he insisted. Balogh explained that DLC.Link utilizes a set of trusted node operators known as "attestors" that run both a Bitcoin node, plus one on the destination chain. A more intriguing alternative comes from Zeus Network, which has come up with a clever protocol that enables BTC to be moved to the Solana DeFi ecosystem in a bridgeless way. The project has created a decentralized "bridgeless" communication layer that sits above the Bitcoin and Solana blockchains to facilitate the transfer of value from one to the other. It relies on the Solana Virtual Machine, and paves the way for Bitcoin liquidity to be used in Solana's extensive DeFi ecosystem. The key component of Zeus's platform is the Zeus Program Library, which is an intermediary between the two networks that makes use of decentralized nodes to maintain custody of BTC, and innovative fraud proofs to prevent malicious activity. To make use of this capability, Zeus has also created a dApp known as APOLLO that Bitcoin holders can use to wrap their BTC into an alternative asset called zBTC that can be used on Solana. APOLLO launched its final testnet phase on August 8 via its Muses upgrade, and it has proven to be extremely popular so far, engaging with more than 30,000 unique wallet addresses already. Bitcoin holders can also opt to go with the more familiar Stacks sidechain, which has been around for some years already, employing a decentralized mechanism to integrate with Bitcoin's underlying blockchain. By using the Proof-of-Transfer consensus mechanism, Stacks makes it easy to bridge BTC to its blockchain, where users can mint sBTC tokens and engage with its ecosystem of DeFi dApps. Alongside Stacks, there's also Rootstock, which allows users to mint rBTC. Babylon is another interesting option for BTC holders, utilizing a novel mechanism to enable the output of a Bitcoin transaction to be used as a stake on the Babylon DeFi platform. The project allows users to stake their BTC tokens on a variety of PoS chains and earn yield for securing those networks. Users might have another way to utilize BTC soon, if the crypto exchange Coinbase makes good on its promises. The exchange recently teased a new asset it's calling "cbBTC" that it's said to be "coming soon". It's designed to bring BTC to Coinbase's Base blockchain, which hosts a small but growing ecosystem of DeFi applications. Is Bitcoin DeFi The Next Big Thing? BitGo's decision to bring more custodians to wBTC as a way to ensure greater trust in the asset could well end up backfiring, as it appears to have given impetus to dozens of emerging projects that are fast executing on alternative, and in many cases, superior ways of putting BTC to use in DeFi. Bitcoin DeFi is fast becoming one of the most important narratives in the crypto industry right now, and it's hoped that as the ecosystem grows, it might kickstart yet another bull run for the world's most valuable digital asset. With the vast majority of BTC sitting idle in the wallets of "hodlers" who are simply hoping and praying for its value to go up, it's clear that there's a lot of potential for these wBTC alternatives, many of which appear to be more secure.

- The spike follows X's suspension in the country, which was mandated by a court. - The social media platform was overjoyed by the sudden surge of Brazilian users. The alternative decentralized X platform Bluesky, co-founded by Jack Dorsey, the former CEO of Twitter, has exploded in popularity in Brazil, amassing an incredible 1 million users in the span of three days. The spike follows X's suspension in the country, which was mandated by a court. The social media platform was overjoyed by the sudden surge of Brazilian users. In what is also the platform's most-liked post ever, we welcomed one million new members in the previous three days. With 21.5 million users, X's sixth-largest worldwide market is now valued at close to the court's verdict according to Statista. However, the surge witnessed moreover, the platform also witnessed a 20% increase in server traffic on Monday, according to a Bluesky backend engineer, who said that the surge of new customers created some technical challenges. Bluesky has around 7.8 million registered users, according to the engineer's publicly available dashboard of stats. Bluesky's features are quite similar to X's; users may share photographs, repost content, and submit updates with up to 300 characters of text. It all started in 2019 with an internal experiment at X that Jack Dorsey pushed. In 2021, the platform achieved independence. Previously accessible only with an invite code, Bluesky registration became publicly available in February. As a result of Musk's defiance of court demands to delete information that was considered unlawful and to establish a local representation, the Brazilian Supreme Court unanimously maintained the ban on X on Monday. This decision follows similar actions taken by Musk in response to requests from other nations. Highlighted Crypto News Today: Solana (SOL) Struggles To Break \$160 Resistance, Facing Potential Drop

- As of this year, digital collectibles have never before achieved a monthly volume below \$400M. - The monthly volume in August is 76% lower than its monthly yearly high. The monthly volume of sales for non-fungible tokens (NFTs) continued its downward trend in August, reaching \$374 million, the lowest monthly sales volume of 2024. As of this year, digital collectibles have never before achieved a monthly volume below \$400 million. The digital collectibles market was worth only \$374 million in August 2024, according to data from NFT tracker CryptoSlam. The monthly volume in August is 76% lower than its monthly yearly high of \$1.6 billion in March of 2024. Steadily Declining With a total of \$4.1 billion in revenue, NFTs had a successful first quarter of 2024. Digital collectibles, however, were unable to maintain the trend, and overall sales fell to \$2.24 billion in Q2, a 45% reduction from Q1. Sales for NFTs have been steadily declining since April, when they fell to \$1.2 billion, notwithstanding a spike in the last week of August. After that, in May, when monthly volumes of NFTs reached \$598 million, there was an even greater decline. There were \$427 million in sales for NFTs in July. Nevertheless, NFT transactions increased by 87% in July, even if monthly sales volumes were lower than expected. In July, there were 10.7 million NFT transactions, up from 5.7 million in June, according to the data. The overall number of NFT transactions in August was 7.3 million, down 31% from the previous month. In contrast, the average NFT sale was worth \$50.74, a 27% increase from \$39.93. The average selling price for NFTs rose to \$86.04 only two days into the month of September. Memecoins have allegedly been a beneficiary of this cycle's speculative capital. Memecoins are replacing NFTs as the more preferred investment by investors. Highlighted Crypto News Today: Solana (SOL) Struggles To Break \$160 Resistance, Facing Potential Drop

- Binance burnt 1.193% of the total supply of Terra Luna Classic tokens on September 1st. - Nearly 65B LUNC tokens have been burnt by the exchange in the last two years. After burning an additional 1.19 billion Terra Classic tokens, Binance's LUNC burn totaled approximately \$65 billion. In the midst of a wider crypto market selloff and discussions about validators violating chain rules, the price of Terra Classic token in spot and derivatives markets has not recovered this time. Binance, a cryptocurrency exchange, burnt 1.193% of the total supply of Terra Luna Classic (LUNC) tokens on September 1st. Additionally, 5.96 million LUNC in taxes were reported for the burn transaction. Collaborative Effort The cryptocurrency exchange burnt \$97,229.23 in trading fees from July 31 to August 29 in the 25th batch of the LUNC burn mechanism. Nearly 65 billion Terra Luna Classic (LUNC) tokens have been burnt by the exchange in the last two years. As a result of projects, cryptocurrency exchanges, and investors burning LUNC tokens, the total amount of tokens burnt by the Terra Classic community is about 132 billion. But the quantity of the Binance LUNC burn mechanism has decreased dramatically over time. Security and pull request concerns are among the factors that have slowed down the implementation of Tax2Gas. Genuine Labs has recently updated Testnet to the latest binary, which includes Tax2Gas and numerous updates. Prices fell 15% in a week as a result of traders fleeing the market. As the community debates the validity of some validators' violations of chain rules, the price of LUNC falls as well. The JESUSLORD 2 (JIL2) validator was accused in a proposal to have broken the DynComm rule by running a second validator on the same chain. The market is now watching US employment statistics for any more clues about the direction of the next several days. Highlighted Crypto News Today:

- Crypto investment products saw outflows of \$305 million last week. - Bitcoin and Ethereum products led the outflows, with \$319M and \$5.7M respectively. The global crypto market has briefly revived from the market dip, with the total market cap bouncing back to \$2.05 trillion, marking a 0.23% increase. Notably, the trading volume has surged by 66.12% to \$69.11 billion in the last 24 hours. Meanwhile, the digital asset investment products saw outflows totaling \$305 million last week. Global crypto investment asset managers such as Ark Invest, Bitwise, Fidelity, Grayscale, BlackRock, ProShares, and 21Shares returned to net outflows last week. According to CoinShares' report, the total net inflows for all issuers amounted to \$543 million in the past week. Bitcoin (BTC), Ethereum (ETH), and Solana (SOL) were the dominant tokens influencing the market flows. Recent reports reveal that the digital investment asset markets globally have undergone remarkable outflows. Notably, the US markets saw outflows totaling \$318 million, with Germany noting an outflow of \$7.3 million. Comparatively, Sweden witnessed a smaller outflow of \$4.3 million. Meanwhile, Canada and Switzerland saw minor inflows of \$13.2 million and \$5.5 million, respectively. CoinShares Head of Research James Butterfill stated that the outflows came amid the widespread negative sentiment evident across various providers and regions, which is driven by stronger-than-expected economic data in the US, which "diminished the likelihood of a 50-basis point interest rate cut." A Downturn in Investment Product Sentiment? The largest cryptocurrency, Bitcoin, has witnessed investment products in net outflows of \$319 million over the last week. Moreover, the short Bitcoin funds observed a second week of consecutive inflows since March, totaling \$4.4 million. Bitcoin spot ETFs had a weekly net outflow of

\$277.12 million. Meanwhile, the largest altcoin, Ethereum, noted a \$5.7 million outflow. While the Ethereum spot ETFs observed a weekly net outflow of \$12.60 million. However, Solana saw \$7.6 million in inflows. Blockchain has seen \$11 million in inflows, notably into Bitcoin miner-specific investment products. Highlighted Crypto News Cardano Initiates Chang Upgrade Granting Governance ADA Token

The light-hearted nature of crypto has bounced back into the limelight during crypto's latest purple patch, with the rise in crypto prices this year accompanied by a resurgence in so-called memecoins, led by the likes of Dogecoin, Pepe and Shiba Inu. According to data from BDC Consulting, the number of meme-related projects in the crypto space has jumped more than 440% in the last couple of years, making memecoins the fourth-most valuable sector in the industry, ahead of both decentralized finance and blockchain services. However, a more recent report from Chainplay notes that anyone thinking of dumping their life's savings into the latest memecoin should proceed with caution. The State of Memecoin 2024 report notes that the average life expectancy of such projects is less than one year – around a third of the lifespan of more purposeful crypto projects. This aligns with the fact that almost 60% of investors in memecoins see these tokens as short term bets. It also explains why a whopping 97% of all memecoins have already ceased to exist. The Rise Of The Memecoin Trend Before they die, a lot of new memecoins tend to explode in popularity, and much of the enthusiasm for new projects stems from the incredible success of the original memecoin, known as Dogecoin. It was created back in 2013 as a joke based on the then-popular Doge internet meme featuring a Shiba Inu dog. The coin featured a humorous image and attracted a wildly enthusiastic fan base that often used it for charity, tipping and fun. In addition, its popularity was boosted no end by the one and only Elon Musk, who has tweeted about it numerous times over the years, hailing it as a potential world currency and boosting its price. The success of Dogecoin led to the emergence of a glut of memecoins that followed in its wake, either trying to replicate the formula it used or creating their own. Some were very similar, such as the Dogecoin clone Shiba Inu, while others, like Dogelon Mars, tried to cash in on Elon Musk's close association with crypto. Floki Inu and Samoyedcoin were other dog-inspired memecoins, and others have since emerged that are based on pop culture, such as the irrepressible Pepe, the adult-themed token CumRocket, and HarryPotterObamaSonic10Inu. There are manifold reasons behind the surging popularity of some memecoins. For one thing, they're funny and appealing, and they're also very cheap and easy to buy, lowering the barrier to entry. Many have the coin of Doge as a reference for many others, and some also benefit from social media and bandwagon effects, where more people buy into the themselves to be unsustainable. Some of the challenges they face, and the reason for their decline, include a simple lack of innovation. Many memecoins are basically just clones, or forks, of existing tokens, and they don't offer any novel features or compelling use cases. Their appeal is based solely on the meme they represent, which is not enough to sustain interest in them. Others have been encumbered with poor tokenomics and governance models that left them vulnerable to dilution, inflation, manipulation and scams, while others were plagued by low liquidity and high fees that hindered the ability of users to trade them. As a result, the crypto industry has had a mixed reaction to the rise of memecoins.

According to Chainplay's report, one in six investors describe memecoins as a must-have in their crypto investment portfolios. Proponents of memecoins say they represent the simplest and purest examples of crypto's promise to democratize finance. The great thing about memecoins is that anyone can launch them, based on any kind of meme. Some of the more humorous examples include Smoking Catfish and Kamala Harris. In addition, a lot of celebrities and influencers have attempted to cash in on the concept, with the likes of Iggy Azalea, Caitlyn Jenner and even Andrew Tate launching their own memecoins. On the other hand, some of the more serious voices in the crypto world have called out memecoins for perpetuating the dump-and-dump stigma that has long plagued the industry and arguably hindered its mainstream adoption. They include Ethereum co-founder Vitalik Buterin, who criticized memecoin culture in a post on X, adding that if they want to be beneficial, they should create some kind of a public-good goal. He stated his belief that new tokens, memecoin or not, should be made to last for decades rather than simply bubbling around for a few months until they're forgotten. Building A Lasting Impact Some memecoin projects appear to have heeded those words and are making extra efforts to have a more lasting impact on the crypto world. The finest example is, of course, Dogecoin, which has become accepted by more than 50 established brands globally, after getting traction as a currency for tipping and charity. A more recent example is LADYS, which is a memecoin founded last year as a homage to the popular Milady NFT collection. LADYS benefitted immensely from a tweet by Elon Musk shortly after it launched, boosting its availability on numerous well-known crypto exchanges, and at one point its market capitalization exceeded \$100 million. LADYS, which bills itself as a tokenized, fully memetically optimized white pill, is a shining example of how a memecoin community can come together to make something out of nothing. While the fun behind it continues, the LADYS has also intrinsic value or expectation of financial return. The team have established a vision that aims to build up the token's brand and create a actively engaging environment where its community will thrive on playful interactions and a shared enthusiasm to keep the project alive. It also wants to create more unity among memecoins through friendly rivalries, fostering a healthy spirit of competition that, hopefully, will encourage other memecoin projects to up their game. To that end, LADYS has set about moving from the digital realm to the physical world, with plans to launch a selection of LADYS-branded merchandise that will be sold via its website, giving more utility to the LADYS token and increasing its brand recognition. This plan mirrors a growing trend in the memecoin space, which has seen a number of tokens attempt to tap into their community's enthusiasm through merchandise. For instance, the biggest cat-themed memecoin on Solana, Wen Coin, recently partnered with Adidas to create its first product, a series of adorable Wen Cat plushies. They're following a model first claimed by popular NFT projects, such as Pudgy Penguins, which generated a remarkable \$10 million in revenue from the sale of its own plushies. Other memecoins have opted to pursue different strategies in an effort to make themselves more meaningful. For instance, Floki Inu has announced it's supporting a charity co-founded by Kimbal Musk, the father of Elon. Through this partnership, designed to appeal to environmentalists, a portion of its transaction fees will be donated to urban gardening projects across the globe. Some Memecoins Can Thrive While some memecoins are clearly becoming more organized and trying to establish some kind of meaning beyond the meme itself, their future will inevitably be defined by market demand and community sentiment. Let's we forget, memecoins are driven primarily by their memes and the hype they generate. These projects can be exciting, fun and entertaining, but investors should remember that such investments are also fraught with risk. However, those memecoins that can maintain the interest and enthusiasm of their communities, whether that's through merchandise, partnerships or other kinds of initiatives, have a good chance of carving out a long-term and sustainable future.

The InnoBlock 2024 will be grandly held at the Singapore Expo from September 16th to 17th, 2024. InnoBlock 2024 is a community-driven, builder-centered event dedicated to driving innovation and development in Web3 applications, empowering the industry. The main forum of the InnoBlock 2024 will focus on the theme of "Builder-Centered Innovation". The event will bring together blockchain leaders from more than 20 countries, and over 100 industry leaders from Web3's top public chains, venture capital (VC) firms, exchanges, media communities, and renowned projects, who will engage in face-to-face, in-depth exchanges and discussions with attendees. To further enhance interaction between project teams and users, and to help project teams more effectively connect with top VCs and leading blockchains, ABGA, BBS, Polaris Marketing, and Footprint Analytics have jointly organized the Airdrop DemoDay event. This event not only offers an exceptional platform for exhibiting projects to showcase their innovative achievements but also aims to enhance participants' engagement and experience through interactive sessions such as token airdrops, thereby achieving a win-win scenario for both project promotion and investment matching. It is anticipated that over 50 projects will participate in on-site roadshow presentations, attracting the attention of more than 40 leading investment institutions and public chains. The Airdrop DemoDay will take place on the Open Stage at the InnoBlock 2024, divided into three sessions: the afternoon of September 16th, and the morning and afternoon of September 17th. Each participating project will have 10-15 minutes for a presentation and Airdrop interaction, offering unique game previews to the audience and showcasing the future potential of blockchain technology. Additionally, the event features five 30-minute VC panels, presenting an unprecedented investment dialogue and providing invaluable opportunities for participants to engage in deep conversations with top investors. The morning showcase will run from 10:30 AM to 12:30 PM local time, with six presentation slots, while the afternoon showcase will be from 2:00 PM to 5:45 PM, featuring 13 presentation slots. The Airdrop DemoDay has specially invited leading investment institutions and public chains from the Web3 industry. Participating VCs include Republic, DFG, K300 Ventures, LK Venture, Waterdrip Capital, PlutusVC, IVC, Delphi Digital, Jsquare, Spartan, Gam3girl Ventures, Gumi Cryptos Capital, CGV, Capital6 Eagle, Taisu, Vega Ventures, LeLand Ventures, SevenX Ventures, Comma3 Ventures, Phoenixtree Capital, as well as investment departments from Sei, Manta, Immutable, Starknet, BNB Chain, Solana, Ton, and Kaia public chains. Furthermore, VCs from the ABGA ecosystem will also participate, such as Bitrise Capital, Chain Capital, F8C Capital, Spark Digital Capital, Westworld Capital, KOI Capital, Cryptomeria, Mint Ventures, Big Candle Capital, Avatar, IBG, Lead Capital, CryptoBuddy, 2140 Ventures, Bing Ventures, and Huobi Ventures. For projects seeking to connect with top investment institutions and public chains, InnoBlock 2024's Airdrop DemoDay offers a rare platform for exhibition and networking. Not only do projects have the chance to showcase their innovative achievements on this stage, but they can also attract widespread attention from target users through interactive forms like token airdrops, thereby accelerating project implementation and development. Project teams interested in showcasing on this stage should not miss the opportunity to register for the event. Appendix: - Airdrop DemoDay Registration Link: <https://forms.gle/vr4MLro4niAq42dx7> - InnoBlock 2024 Registration Link: <https://lu.ma/srlcywnc>

JPool is a user-friendly, transparent, and profitable liquid staking platform operating since 2021 and offering a range of flexible staking products and auxiliary tools. Currently based on Solana, JPool is evolving into a multichain platform, connecting users to a wealth of liquid staking opportunities across the crypto space. JPool is introducing the JPool Holders Club, an exclusive membership community within the JPool ecosystem, dedicated to recognizing and rewarding its most committed users. The Club grants its members access to exclusive privileges and benefits through a point system. Anyone can become a member of the Club and start collecting JPoints to advance through membership tiers, which unlock new sets of privileges – the higher the tier, the higher the value. At JPool, we deeply value our community and believe in the power of collective involvement. We've created the JPool Holders Club to reward those who actively participate and contribute to the growth of our platform. We hope you will enjoy these new opportunities. Becoming a member is really easy. A user needs to simply connect a wallet and get a free membership card. This card will be issued in the form of an NFT by decentralized identity (DID) platform Albus Protocol, JPool's technology partner. Once in the Club, members can collect JPoints in a number of ways. They can farm them by holding JSOL in their wallet, or earn them by completing social quests on Galxe and referring others to JPool via its Referral Program. They can also boost the farmed JPoints by staking early with JPool, or by providing liquidity or loans to JPool's DeFi partners. Early-bird stakers contributing large amounts of JSOL to partner DeFi protocols stand to reap the most of the benefits. In September, JPool will also launch a Telegram-based tap-to-earn game Pumpjack, where users will produce natural resources and exchange them for JPoints. JPool is supported by a strong network of investors and backers, including Solar Eco Fund, Solana Foundation, Big Brain Holdings, Cryptology Asset Group, and Genblock Capital. Additionally, JPool partners with prominent DeFi protocols such as Metagor, Mango Markets, Save, Raydium, and Orca to provide its users with broad opportunities to earn extra on JSOL. You are welcome to follow us on X, Discord, Telegram, or to dig deeper into how the Club works on its About page. About JPool JPool's key products include Smart Staking, which enhances the staking experience through a smart delegation strategy, and Flex Staking, allowing for customizable staking based on individual preferences. JStaking provides reliable staking with a trusted institutional-grade partner validator based in Switzerland. The platform also offers JPool Insights for comprehensive accounting and reporting, Smart Validator Toolkit (SVT) for setting up and maintaining Solana validators, and a proprietary Validator Dashboard with key metrics like stake distribution and concentration. - Bitcoin price has dipped by an additional 0.57% in the last 24 hours. - The cryptocurrency's daily trading volume has spiked by 76.73% according to CMC data. The crypto market turned bearish yet again over the weekend with the largest cryptocurrency showing significant price dips. Bitcoin's price dip has rendered uncertainty in the market with altcoins showing volatility and turning bearish. As prices have raised a tumult there has been a lull in activity within the crypto sector. Bitcoin began its downward movement on August 30 as prices struggled to stay at \$60K. While investors held out expectations for bullish turns, BTC failed to factor in the positive momentum. Subsequently, on September 1, it traded at

\$58K levels and recorded an additional 1.30% price decline in the last 24 hours. Moreover, in the early Asian hours of September 2, Bitcoin price slid to a weekly low of \$57,128. After this, the token is currently attempting to show slight upward movements. At the time of writing, Bitcoin was trading at \$57,720 as per CMC data. Zooming out, over the past week, the crypto asset has recorded a 9.71% decline in prices. The token, 7 days ago, having witnessed a bullish momentum traded at a high of \$64,001. Following this, as bearish movements took over, prices slid to current levels. Parallely, the US spot Bitcoin ETFs have also shown considerable outflows in both weekly and daily investor activity. According to SosoValue data, the spot BTC ETFs recorded daily net outflows of \$175.67 million as of August 30. How has the Bitcoin Price Affected Market Sentiment? As aforementioned, Bitcoin price has declined over the past week. Additionally, the token has also recorded a 21-day moving average below the long-term 21-day MA at \$59,795 as per TradingView reports. Moreover, BTC's RSI stands at 41.72 showing an existing selling sentiment among investors. However, according to LookOnChain reports, a particular whale was seen buying 1K BTC in the last few hours. Contrastingly WhaleAlert reports stated several whales dumping Bitcoin in leading exchanges. This shows that while some investors have bought tokens during the drop others have shown selling movements. Highlighted Crypto News Today: Michael Saylor Reveals Bitcoin's Success Formula Amid Price Decline

Michael used the X platform to debunk the myth that Bitcoin's success was just coincidental. MicroStrategy started hoarding BTC in 2020 and their holdings increased to 226,500 bitcoin. In the days after a market meltdown, Bitcoin's price has been steadily declining. Bitcoin has lost about 8% this week and is trading at \$58.18K as of this writing. In light of this, many have questioned Bitcoin's development potential and wondered how the cryptocurrency has managed to accomplish so much despite its current struggles. Many have raised this concern, and some have even suggested that it's completely coincidental. However, Michael Saylor has emerged to expose the hideous reality of this cryptocurrency's growth. Not Just Coincidental Michael used the X platform to debunk the myth that Bitcoin's success was just coincidental. Bitcoin has achieved unprecedented levels of success, and he laid out the recipe for that success in the piece. According to the post, the formula for Bitcoin's success is as follows: 32 halvings, 21M total tokens, 50 new token releases every block. Plugging these numbers into the formula from previous halvings yielded the desired result. When put together, they provide an ideal description of this token's operation. How well it has been built to become a super currency is more significant. It is now very evident why the corporation has been so fixated on Bitcoin, according to Michael Saylor's presentation of the asset's appeal. MicroStrategy started hoarding bitcoin in 2020, and in that time, their holdings increased to 226,500 bitcoin. Metaplanet, a Japanese business, is also increasing its Bitcoin purchases in an effort to compete with MicroStrategy. El Salvador is only one of many nations that has backed this token; the country's wealth consists of over 5,748.76 BTC, with a value of almost \$340,687,039. Furthermore, El Salvador has only lately implemented a certification program that offers to transform its continuing investments via the use of Bitcoin as an investment strategy. Highlighted Crypto News Today: Solana Price Drops to \$130 Range Testing Critical Support Levels

- This comes after Elon Musk's refusal to name a legal representation for the company. - Users in Brazil who use the X platform said they could still access it. X (formerly twitter), a social media platform, has been stopped in Brazil by an order of a Brazilian Supreme Court judge, after Elon Musk's refusal to name a legal representation for the company. As stated in an Associated Press report from August 30, Justice Alexandre de Moraes carried out his threat to shut down X's activities in Brazil in the event that Musk did not designate a legal counsel by August 29. The platform would defy [Moraes's] unlawful demands to suppress his political opponents, according to X's Global Government Affairs team. Ongoing Tussle What X may do next for Brazilian users is uncertain. According to Musk's many posts, Justice Moraes was a "dictator" and "evil" because of the alleged unlawful political censorship he engaged in. X was the subject of Moraes's investigation because of the spread of false material on Jair Bolsonaro, the former president of Brazil. Users in Brazil who use the X platform said they could still access it. Of the approximately 217 million people living in the nation, about 20 million use X, according to Statista. The decision came after satellite provider Starlink announced on August 29 that Justice Moraes had blocked the business's Brazilian finances. Starlink is a subsidiary of Musk's other firm, SpaceX. On the other hand, with a dismissal of the case citing the tweets as "aspirational and puffery," a US district court sided with Elon Musk and Tesla in the DOGE manipulation lawsuit. Elon Musk has stated his intention to reinstate Dogecoin payments for Tesla products after the victory. Highlighted Crypto News Today:

- Bukele acknowledged he had not seen as many advantages as he had hoped. - Time magazine named the president the most popular authoritarian in the world. After legalizing Bitcoin as legal tender, Salvadoran President Nayib Bukele expressed disappointment that the country's adoption of the cryptocurrency had not progressed as far as expected. Although he acknowledged he had not seen as many advantages as he had hoped, Bukele said in an interview with Time magazine that Bitcoin (BTC) adoption was a "net positive" for El Salvador. The interview was published on August 29. In his remarks, the president drew parallels between the government's "voluntary" and non-enforced adoption of Bitcoin and its attitude toward demonstrators. Bukele stated: "[A] lot more could definitely be done. Bitcoin hasn't had the widespread adoption we hoped for. Many Salvadorans use it; The majority of large businesses in the country have it. You can go to a McDonald's, a supermarket, or a hotel and pay with Bitcoin. It hasn't had the adoption we expected." Crackdown on Crimes Moreover, Time magazine named the Salvadoran president the most popular authoritarian in the world, and in an Aug. 29 X post, he seemed to celebrate this label. The murder rate in El Salvador has come down dramatically since the new government took office in June 2019. But many have said that his administration's crackdown on gang activities, which includes arresting opponents of the administration, violates human rights. Despite reports that police used tear gas and batons to quell protests, Bukele said El Salvador remained the most secure nation in the Western Hemisphere. Bukele gained the attention of many in the cryptocurrency sector in 2021 when, at the Bitcoin Conference in Miami, he stated his intention to have El Salvador accept Bitcoin as legal tender. Highlighted Crypto News Today: Solana (SOL) Drops 25% in a Month, Falling Below Key Moving Averages

- Durov is now free on a 5-million-euro bail-bond arrangement. - Toncoin (TON) has the largest market valuation in the TON ecosystem as of Aug. 26. With a market valuation of \$13.96 billion and more than 1.1 million daily active users (DAUs), Toncoin has lately achieved tremendous success inside the TON ecosystem. Toncoin (TON) has the largest market valuation in the TON ecosystem as of Aug. 26, according to statistics from IntoTheBlock (ITB). It reached the DAUs milestone on May 13. Two days before this, at Le Bourget airport outside of Paris, Telegram CEO Pavel Durov was apprehended. And TON soared to the top of the TON ecosystem's market value. Data from the ITB shows that significant stakeholders controlled 98% of the tokens in two TON ecosystem tokens, Gomingin and Ston, indicating a high concentration of whale investors. As of August 19, before Durov's arrest, this concentration of whales was correct. Although this shows support for the ecosystem, there is a danger of volatility due to the effect of whales. As huge holdings might drastically affect market movements. Ongoing Legal Turmoil Just one day after the news of Durov's incarceration spread, the price of Toncoin plummeted 25% to \$5.24 on August 25. Multiple market and technical indicators showed that TON could be ready for the subsequent comeback, despite the price drop and change in market attitude. While visiting Serbia on a diplomatic mission, French President Emmanuel Macron denied knowledge of Durov's travel to France and denied ever inviting him at a news conference on August 29. After being prosecuted by French prosecutors, Durov is now free on a 5-million-euro bail-bond arrangement. However, he is obligated to stay in France and check in with law authorities on a weekly basis. Highlighted Crypto News Today: Solana (SOL) Drops 25% in a Month, Falling Below Key Moving Averages

- BlackRock's IBIT had net outflows of \$13.51M, marking its first negative flows since May 1. - Only one spot Bitcoin ETFs, Ark and 21Shares' ARKB, received \$5.34M in net inflows. The three-day losing skid for U.S. spot bitcoin exchange-traded funds continued on Thursday with net outflows of \$71.73 million. Data from SosoValue shows that BlackRock's IBIT, the biggest spot bitcoin ETF by net assets, had net outflows of \$13.51 million, marking its first negative flows since May 1, and second since debut. On Thursday, \$22.68 million left Grayscale's GBTC, continuing its outflow streak, while \$31.11 million left Fidelity's FBTC. The BITF fund managed by Bitwise also lost \$8.09 million, while the BRRR fund managed by Valkyrie lost \$1.68 million. Only one spot Bitcoin ETFs, Ark and 21Shares' ARKB, received \$5.34 million in net inflows. Compared to Wednesday's total of \$2.18 billion, Thursday's overall trading volume for the 12 spot bitcoin ETFs dropped to \$1.64 billion. Net Outflows Recorded by Spot Ether ETF On the other hand, after a day of moderate positive flows, U.S. spot Ethereum ETFs resumed negative flows on Thursday, with net outflows of \$1.77 million. Out of all the spot ether ETFs, only Grayscale Ethereum Trust (ETHE) saw outflows of \$5.35 million. A net inflow of \$3.57 million was received by the Grayscale Ethereum Mini Trust (ETHM) which offset this. On Thursday, no money from the other seven spot ether funds were recorded. After reaching \$151.57M on Wednesday, the combined trading volume for all nine ETFs dropped to \$95.91M on Thursday. Amidst the current uncertainty in the cryptocurrency market, Bitcoin (BTC) has seen a precipitous decline, falling from about \$65,000 to less than \$59,000 in the last few days. Market responses to recent economic data and wider financial trends are among the variables that have contributed to this negative move. Highlighted Crypto News Today:

- Dogecoin's price rose 4.02% from \$0.09854 to \$0.1018 after the lawsuit against Musk and Tesla was dismissed. - Dogecoin is at a key support level of \$0.15. If it holds, the price could rise to \$0.13 and even \$0.15 soon. In the last 24 hours, Dogecoin (DOGE) saw a modest uptick of 4.02%, reaching \$0.1025 as it attempts to recover from recent setbacks. The slight boost in price was followed by the dismissal of a federal lawsuit against Elon Musk and Tesla, with the court ruling that Musk's Dogecoin-related tweets were not misleading but rather optimistic expressions. Despite the price increase, Dogecoin's trading volume experienced a 19% decline, settling at \$467 million. This decrease in activity reflects the broader market's cautious stance, as DOGE continues to mirror Bitcoin's trend, with BTC trading below \$60K. Interestingly, Dogecoin's gradual price increase suggests a healthier, more sustainable growth pattern, allowing for the establishment of stronger support levels. Reports indicate that large holders of DOGE have been accumulating, signaling confidence in the meme coin's potential. Technical Outlook and Price Targets for Dogecoin DOGE is currently at a pivotal price point. According to the Dogecoin price prediction, the coin's price is slightly above its 9-day moving average (MA), which means the current price is just a bit higher than the average price over the last nine days. This can indicate a short-term upward trend. Further, the relative strength index (RSI) of 47.33, indicates a neutral stance in the market. The meme coin's price might stay steady or move slowly in the upper direction. In that case, a successful defense of the \$0.105 support level could potentially ignite a bullish trend, with the price possibly reaching \$0.13 in the coming week. Should Dogecoin break past \$0.13, the next target could be \$0.174, setting the stage for a continued upward trajectory. Conversely, if the \$0.10 support fails, DOGE could slip to \$0.095, putting further gains at risk. Overall, the market sentiment around Dogecoin remains optimistic, with social media buzz reflecting its sustained popularity despite recent price fluctuations. Highlighted News Of The Day

This summer, SunPump has emerged as a standout product in the crypto market, sparking a new wave of the meme coin craze. As the first fair launch and trading platform for meme coins on the TRON ecosystem, SunPump has managed to rival its competitor, Pump.fun on Solana, in daily coin issuance and protocol revenue within just two weeks of its debut. Moreover, it has rapidly nurtured its flagship project, SUNDOG, which now boasts a market cap of over \$270 million. Source: Data from CoinMarketCap on August 27, 2024 (UTC) Meme coins, from DOGE to PEPE, have evolved over the past decade. With the increasing accessibility of launching new coins and the continuous emergence of new projects, cultivating a project with great growth potential requires bold and innovative strategies. HTX played a key role in SunPump's success. Their partnership, facilitated by Justin Sun, the founder of TRON and a member of the HTX Global Advisory Board, utilized both on-chain and off-chain strategies to create a win-win scenario, marking a game-changer in the meme field. Streamlining the Listing Process, HTX Backs Meme Coins on SunPump A significant challenge often encountered by meme projects is getting listed on a top-tier cryptocurrency exchange. These exchanges, with their extensive user bases and easy-to-use trading platforms, can significantly enhance a meme project's visibility and trading volume, driving up its price in the secondary market. However, from the exchanges' perspective, listing meme coins usually requires meeting stringent standards due to factors such as security and environmental concerns. Even a supposedly "mild" coin like PEPE had to wait over two weeks after its launch before being listed on major exchanges, like Binance. Promising meme projects in the TRON ecosystem are no longer faced with these hurdles. The partnership between HTX and SunPump has greatly simplified the listing process. Projects on SunPump that meet HTX's listing criteria and sustain a trading volume above \$10 million for three consecutive days or achieve a market cap of \$30 million can be listed directly on the exchange and immediately benefit from the platform's

traffic. Additionally, HTX delivers customized and diverse solutions to SunPump meme projects, offering everything from futures trading and Earn products to PrimePool and airdrops, fostering meme coins with strong growth potential. HTX's support has contributed to the rise of SUNDOG, which has become one of the top meme coins of the summer. After its listing on HTX, SUNDOG sustained its upward momentum, reaching an all-time high of more than \$0.35 on August 26. Positioned as the People's Exchange, HTX Empowers Users to Enjoy High Returns with Ease. Users are those who profited the most from the impressive price increase. HTX data reveals that SUNDOG has gained great popularity since its listing. As of 11:00 (UTC) on August 27, 2024, SUNDOG had skyrocketed nearly 2,600%, with a 24-hour trading volume exceeding \$30 million, making it the 6th most traded crypto on the platform. This underscores the evident and strong recognition from users. Source: Data from HTX as of 11:00 (UTC) on August 27, 2024. In addition to SUNDOG, SunPump also introduced FOFAR, SUNCAT, SUNWUKONG, DRGN, IVFUN, and other meme projects to HTX. All of these projects surged by over 100% following their listings, demonstrating that this collaboration has generated huge wealth effects. HTX's listing criteria for SunPump-affiliated meme coins prioritize the security of listed projects. Only projects that have proven themselves and stand out in the market and decentralized exchanges qualify for listing on HTX. Besides, each project also undergoes rigorous security checks by the HTX team prior to listing. This careful vetting process safeguards users from common on-chain risks, such as rug pulls, allowing them to trade quality projects with assurance. It also incentivizes project teams to take their projects seriously. Essentially, HTX uses metrics such as community engagement, trading volume, and market value to decide whether to list a project in the SunPump ecosystem. This mechanism represents an early achievement in the exchange's decentralization efforts, moving HTX closer to its aim of becoming the "People's Exchange". HTX Makes a Bold Leap, Taking the Lead in the Meme Season HTX, as the primary gateway to the TRON meme ecosystem, has shown outstanding growth. According to DeFillama, as of August 27, HTX experienced an influx of new capital of \$1.67 billion over the past seven days, outperforming all other exchanges in their dataset. CoinMarketCap also places HTX among the highest-ranking exchanges in terms of 24-hour trading volume and weekly visits. Source: Data from DeFillama on August 27, 2024 (UTC). From a strategic standpoint, listing quality assets has always been a central focus and strength for HTX. The partnership with SunPump enables a seamless integration between centralized (CEX) and decentralized exchanges (DEX), connecting the abundance of investment opportunities in the TRON ecosystem to a broad user base. This approach facilitates the discovery of premium meme coins and maintains HTX's leadership in the listing of new assets. By establishing meme coins as a flagship offering and using their wealth effect to draw more users, HTX aims to make its current growth the new norm for the future. Since his enrollment at the HTX Global Advisory Board, Sun has set the goal for the platform to reclaim its position among the top three exchanges. Currently, HTX is spearheading the meme boom with its unique innovations, and this could be the catalyst it needs to reclaim its position as a top-three exchange.

- Ethereum (ETH) remains consolidated within the \$2.6K range. - ETH's fear and greed index suggests a sentiment of fear in the market. The overall crypto market displayed mild dips in market cap and trading volume throughout the week. Bitcoin (BTC), the largest cryptocurrency, has stepped into bearish turns, trading below \$59K. The largest altcoin, Ethereum, endured a sturdy month, witnessing critical losses with its price dipping to \$2.2K. Notably, ETH witnessed modest price dips in the past day. The daily price chart shows the token's struggle to keep the price from sliding below \$2.5K. ETH managed to trade at \$2,512 while recording a 0.81% daily price dip, at press time, according to CMC data. The price momentum of ETH was observed in the range between \$2.6K and \$2.7K from last Saturday to the 27th of August. Later, the price slid below \$2.6K. Meanwhile, Ethereum's market sentiment continues to stay in the fear zone, as the fear and greed index stays at 37. Moreover, the weekly update of Grayscale reveals the top 10 crypto assets by 1-week returns, with Ethereum having secured 4th place this week. On the other hand, a whale claimed 30,007 ETH, worth \$78.67 million, and deposited 24,007 ETH (\$61M) to Coinbase over the past three days, retaining 6,000 ETH, valued at \$15.16 million. Simultaneously, a new wallet withdrew 21,912 ETH (\$55.32M) from Coinbase and staked it in Lido. Over the last 24 hours, Ethereum observed a 1.1% price dip, trading at \$2,512. Meanwhile, the daily trading volume has plummeted over 23% to \$14 billion. Is a rebound possible for ETH? ETH observed a NOBODY'S BEING BOSS trading at 1.00, trading at a low of 2.22 on the 27th of August. The price is continuing over the past week with a 4.38% plunge. The asset's price has been range-bound between \$2,809 and \$2,433. The asset's daily relative strength index (RSI) is 39.47, slightly closer to the oversold zone in the market. Besides, the daily frame of ETH highlights the bearish state as the short-term 9-day and 21-day moving averages (9MA and 21MA) were noted above the current price at \$2,622 and \$2,623 respectively. Ethereum's successful breakout at \$2.6K could pave the way for ETH to test the initial resistance at \$2,696. Conversely, if Ethereum falls below \$2.5K, it may enter into and prolong a period of consolidation. This could even push the asset's price to \$2,353. Disclaimer: The opinion expressed in this chart is solely the author's. It does not represent any investment advice. TheNewsCrypto team encourages all to do their own research before investing.

- Helium (HNT) has seen a price increase of over 10%, rising from \$6.67 to \$7.48. - The rally is driven by two important proposals, HIP 130 and HIP 131, boosting optimism for HNT's future. Amidst a global market downturn, Helium (HNT) is changing the trend and showing significant gains. According to CoinMarketCap, the price of HNT surged over 12.29%, moving from \$6.67 to a recent high of \$7.49, with the upward momentum continuing. This rally comes with Helium's official announcement of the approved proposals, HIP 130 and HIP 131, related to Helium Mobile. HIP 130 suggests expanding the network by allowing non-certified hotspots that use passport authentication. These new hotspots will function similarly to the original Helium devices, but they'll transmit pre-paid data, with users earning MOBILE tokens, part of the Helium ecosystem. HIP 131, which builds on previous anti-gaming action, introduces a system to safeguard the network's reward distribution. The proposal limits Oracle Hex boosts in certain areas, reducing the rewards multiplier for hotspots involved in suspicious activity. To regain the boost, these hotspots must submit accurate Call Detail Records (CDRs). Helium has been in a Resistance Zone After Months of Consolidation, Helium has finally broken the key \$7 resistance zone, marking its first breakthrough since March 21. At the time of writing, HNT is trading at \$7.46, with a 12% increase in market capitalization. Further, Helium's open interest also climbed by 27%, reaching \$7.39 million, indicating strong buying activity. The Relative Strength Index (RSI) has risen from 30 to 63, signaling growing bullish sentiment. Currently, the RSI is in the neutral zone, suggesting that the trend remains balanced and on the frontlines. According to the technical analysis, HNT is trading above its recent averages, with the short-term 9-day moving average at \$7.02 and the long-term 21-day moving average at \$6.85. These figures suggest a strong upward trend, with potential gains exceeding \$8 in the near future. However, the ongoing market dip may pose challenges, potentially limiting this momentum. If HNT fails to maintain its position above \$7, it could drop to a support level of \$6.35, with further declines possible. Highlighted Crypto News Today Indonesia Considers Banning Telegram Amid Multiple Allegations

- Prominent footballer Kylian Mbappe's Twitter account hack saw hackers releasing a \$MBAPPE memecoin. - The token showed significant price surges before plummeting to zero. The memecoin sector holds consistent traders' interests, which results from unique instances. It frequently sees the launch of new tokens apart from several rug-pull incident reports. Relatedly, in the last 24 hours, a memecoin scam was committed related to the prominent football star, Kylian Mbappe. According to reports, the prominent footballer's X account was compromised in the Asian morning hours of August 29. The hackers then proceeded to launch a memecoin named \$MBAPPE which saw huge sales as prices rocketed on the charts. During this time, one particular trader managed to elicit profits from this circumstance. Furthermore, the hack also saw Mbappe's account posting several Ronaldo-Messi pictures which raised suspicions. Additionally, several community members and on-chain watchers reported the token to have seen 90,000 sales before being deleted as shown in Solscan data. Moreover, \$MBAPPE prices surged to "tens of millions" after which it plummeted to zero. While this can be identified as a typical rug-pull incident, the aforementioned trader is known to follow such strategies for his resultant profits. It is not a novelty that crypto experts see market opportunities to witness huge gains, while they might also incur contrasting losses. How Did the Trader Capitalize \$MBAPPE? According to LookOnchain reports, the trader managed to gain massive profits. He sold 0.2 Solana tokens worth \$29 to buy the \$MBAPPE tokens right before its surge. At the memecoin's peak, the trader sold his holdings in exchange for 866.13 SOL worth \$125.16K. Moreover, from these transactions, he managed to make a profit of 4330x returns. Previously, the trader was also seen performing similar patterns of exchanging 0.1 SOL to 0.3 SOL for other memecoins. LookOnchain reports his win rate to be 35.46% and a total profit of \$126.7K. Notably, the Solana blockchain has witnessed the launch of several memecoins over the past few months. The Solana ecosystem also has seen the rise of PolitiFi tokens, revolving around leaders such as Donald Trump and Kamala Harris. - Binance is under fire for freezing Palestinian crypto accounts following orders from the IDF. - The controversy highlights the ongoing tension between cryptocurrency centralization. Binance blocked Palestinian crypto funds. The exchange seized cryptocurrency from Palestinians as per the request of the Israel Defence Force (IDF). They refused to return the funds and all the appeals have been denied. Moreover, the assets are frozen and seized. Also, #BoycottBinance is currently trending on Twitter. In addition to this, People are showing different reactions to this incident, especially the Palestinian supporters. They are saying that Binance is standing with Genocide. Following this, Yi He, Binance Co-Founder & Chief Customer Service Officer replied to an X user saying that the exchange only blocked a limited number of Palestinian crypto accounts that were linked to illicit funds. Binance CEO Richard Teng, who recently replaced the ex-CEO Changpeng Zhao, posted a statement in X saying that, "As a global crypto exchange, we comply with internationally accepted anti-money laundering legislation, just like any other financial institution. We will continue to educate users on how to safely and securely transact on our platform." Furthermore, he says that it is believed that Israel is putting massive pressure on Binance and all other exchanges to blanket seize the funds of all Palestinians. Highlighted Crypto News Today: Solana Price Sees Bearish Takeover After Hitting \$160 Levels

In August 2024, following substantial declines, Bitcoin and Ethereum entered a prolonged period of sideways oscillation. As the market needed new stimuli, meme coins once again became the focus of investors. In the past two weeks, the meme market has been exceptionally hot. Inspired by rags-to-riches stories, a large amount of capital has flowed into the market, and the crypto community is enthusiastically discussing who will be the next golden dog. In previous meme seasons, Ethereum, Solana, BSC, and other chains were the main players, but this time, the leader is a new player from this track: TRON. Currently, TRON's top meme coin, SUNDOG, has been launched for 10 days, and its outstanding performance has attracted the attention of the entire crypto circle. Moreover, SunPump and the entire TRON ecosystem have demonstrated the ability to create more compelling narratives. 4,000x in 10 Days: SUNDOG on Par with SHIB and PEPE SUNDOG has skyrocketed since its birth, becoming a top coin in just 10 days, with its performance even comparable to some established meme coins. On August 16, SUNDOG was launched on SunPump, the first platform for the fair launch of meme coins in the TRON ecosystem. Within less than 3 hours of issuance, its market capitalization exceeded \$10 million. Due to SunPump's partnership with HTX, SUNDOG, as the project with the highest market capitalization on SunPump, was listed on HTX on the first day of its launch. At dawn on August 19, less than 3 days after its launch, SUNDOG's market capitalization exceeded \$100 million for the first time. It's worth noting that PEPE, the most successful meme coin in recent years, took 4 days from launch to reach a market cap of \$100 million. As of the evening of August 25 (UTC), SUNDOG has surged over 4,100x since its launch, with a market capitalization exceeding \$200 million. In comparison, PEPE saw a rise of about 260x within the first 10 days after its launch. Other well-known meme coins with high market cap rankings, such as SHIB, BONK, FLOKI, etc., all remained dormant for a considerable period after launch before experiencing a breakout. It can be said that the wealth effect brought upon by SUNDOG in the first week of its launch has surpassed most top meme coins. TRON Has Held All the Aces to Enter the Meme Sector Of course, SUNDOG still needs to prove its vitality over a longer timeline to truly be mentioned in the same breath as legendary coins like PEPE. However, SUNDOG's meteoric rise has an even greater significance: TRON is redefining the meme game. On August 13, Justin, the founder of TRON and a member of the HTX Global Advisory Board, announced the launch of SunPump, marking TRON's entry into the meme field. Within just one week, TRON had its first meme project with a market cap exceeding \$100 million. This strong rise can be said to be the result of the combined effect of strong support, favorable conditions, and perfect timing. As for the support, looking back at the development history of some top meme coins, the early hype effect brought by influential figures is indeed a DOGE that is deeply ingrained in the crypto world, truly experienced the meme takeover after establishing a connection with Elon Musk; PEPE's rapid growth is also related to the early promotion by a large number of KOLs and the enthusiasm driven by the community. SUNDOG, and even all meme projects on the TRON chain, are naturally tied to one person - Justin, one of the most talked-about and prominent figures in the crypto world. On August 13, Justin announced the launch of SunPump. Since then, he has spared no effort in promoting SunPump and TRON on social media, X (Twitter) Space, and in communities. He even personally engages in meme-making to drive attention to the meme field. Simultaneously, he receives user feedback on one hand and urges the SunPump team to upgrade the platform on the other.

This enthusiasm is the best guarantee for memes in the TRON ecosystem to gain long-term traffic. On public chains like Ethereum, Solana, and BSC, memes have existed for a long time, but these chains lack a meme leader. Therefore, it's difficult for different projects to form a joint force to create a wealth effect, and for users, the gambling component is also greater. Under Justin's guidance, the TRON ecosystem is more likely to give birth to meme projects with topicality and popularity.

– Favorable Conditions TRON is the public chain with the second-largest TVL and holds 99% of USDT reserves, providing fertile ground for ecosystem explosion. At the same time, TRON is the most profitable public chain. On August 21, TRON set a new all-time high since its mainnet launch in 2018 with a record single-day revenue of \$5.33 million. This remarkable achievement gives TRON the confidence and ability to provide even more robust support for ecosystem development. At the beginning of SunPump's launch, it introduced a gas fee reduction event of up to 99% and launched a \$10 million Meme Ecosystem Boost Incentive Program on August 15. Coupled with SunPump's low fees, TRON has a huge appeal to both investors and project teams. For other meme coins, getting listed on top exchanges is often a challenging and time-consuming process, while memes in the TRON ecosystem have unique advantages. Due to TRON's partnerships with HTX and Poloniex, there is a good interaction between the public chain ecosystem and exchanges. High-quality meme projects can be listed on top exchanges at the first opportunity, driving a new round of growth through the exchanges' market advantages; exchanges can also use the wealth effect of memes to attract more users and increase exposure.

– Perfect Timing In fact, in the first half of this year, the Solana ecosystem's meme projects, driven by Pump.fun, also achieved excellent results. However, during that period, Bitcoin and Ethereum garnered increased attention due to narratives related to spot ETFs, halving events, and the Dencun upgrade, while the market experienced significant growth. Now, SunPump has emerged during a sluggish overall market, where liquidity is scarce and investors are actively seeking new targets. This has created one of the most magical wealth effects in the second half of the year. It can be said that TRON seized the opportunity at the most opportune time. SunPump's emergence indeed aligns with the current market dynamics, making it a fascinating development for investors and the TRON ecosystem.

Dimensional Strike: SUNDODG May Be a Repeatable Success With a thriving investment environment and an outstanding leader, plus a bit of market favor, it seems natural for TRON to give birth to a new meme noble like SUNDODG. More importantly, this is just the result achieved by TRON in just over 10 days of entering the meme field. There is even greater capital and traffic potential yet to be tapped on TRON. With Justin's continued efforts, the wealth effect of SUNDODG may very well be replicable. Following SUNDODG, other high-quality projects on SunPump, such as FOFAR, SUNCAT, SUNWUKONG, and BORG, have also been listed on HTX. TRON's meme projects are rapidly coalescing into a collective advantage. Currently, TRON resembles a new continent in the meme world and sustained attention could unveil the next treasure trove.

The crypto game is all about returns, and today we're unveiling pivotal updates on three coins to help you identify the standout of the week. Starting with Polygon's price outlook: MATIC could ignite a bullish charge if it breaches its current barriers. However, a failure might see it plunge to as low as \$0.4120. Monero (XMR) enthusiasts are on edge. Recent underperformances coupled with its ejection from major exchanges have dented its appeal. Meanwhile, BlockDAG's recent team video has gone viral, pulling in over 120,000 holders from 150 nations. In the Spotlight, CEO Anthony Turner outlines BlockDAG's blueprint for the future, which, riding the wave of a \$68 million presale and a staggering 1680% price hike, looks brilliantly promising. Polygon (MATIC) Price Forecast: Bulls on the Horizon? Polygon's MATIC is showing signs of resurgence, rallying from a low of \$0.3920. Having surpassed the \$0.4120 mark, the focal point now shifts to whether it can conquer the \$0.4220 and \$0.4250 resistances. Should it succeed, MATIC could ascend to \$0.4450 or beyond. But should the bulls falter, a fallback to around \$0.4120 might occur, with the coin's trajectory hanging in the balance. Monero (XMR) Investors Fear the Golden Era May Be Over Monero (XMR) once glittered in the crypto arena, yielding hefty returns in 2018 and 2021. But its recent trajectory has been less than stellar. Its privacy-centric approach has attracted regulatory scrutiny, leading to its delisting from key exchanges. Currently lingering around the \$150 mark, XMR has recorded a 6% annual decline, hinting that its heyday may be fading into the rearview. BlockDAG's Viral Team Video: 120k+ Holders and Counting After a groundbreaking \$68 million presale, BlockDAG released a team video that quickly captured global interest, amassing over 120,000 holders worldwide. CEO Anthony Turner shared insights into their strategic global expansion, particularly highlighting new setups in London and St. Kitts and Nevis, chosen for their strategic importance in bolstering global reach and solidifying regulatory and developmental ties. Turner shed light on BlockDAG's cutting-edge hybrid technology, melding Bitcoin's security, DAG's speed, and Ethereum's interoperability. This positions BlockDAG as a formidable contender against behemoths like Ethereum and Solana. Turner's three-year vision? Elevating BlockDAG to a top-tier Layer 1 blockchain status. With strategic expansions and robust community support, BlockDAG is setting the stage to be a blockchain powerhouse. The current presale price stands at \$0.0178 per BDAG coin, with the looming close of batch 22 hinting at a potential 5500% ROI if the coin hits its anticipated \$1 mark by 2025. Week's Top Crypto Contenders While Polygon (MATIC) braces for a potential bullish rally amid uncertainties, and Monero appears to wane from its former glory with continued market coldness, BlockDAG's presale shines through the prevailing market turmoil. The recent team video has catapulted the project into a promising trajectory, potentially lining up BDAG coin to be a significant player in the future crypto scene. As batch 22 nears its end, the anticipated \$1 mark offers a tantalizing 5500% ROI opportunity for early adopters. Learn About BlockDAG's "Act Now Before Prices Increase": Presale: <https://purchase.blockdag.network> Website: <https://blockdag.network> Telegram: <https://t.me/blockdagnetwork> Discord: <https://discord.gg/Q7BxghMvYu> Disclaimer: TheNewsCrypto does not endorse any content on this page. August witnessed the most severe market downturn of 2024, with major cryptocurrencies including Bitcoin plummeting. Driven by recession fears, geopolitical tensions, and harsh market corrections, the initial gains of the bull market have been completely erased, slashing the overall market cap by 20%. In this downturn, Cardano (ADA) has seen its growth stall significantly. Its development activity plummeted by 75% within just a month. Similarly, PEPE's prospects are dimming, with its price now nearly 40% below its peak. In stark contrast, BlockDAG emerges as a top contender for success. Its presale, spanning 45 stages, has bucked the negative trend. From its first batch, BlockDAG's price has surged by 1680%. Now, with \$68 million raised in presale revenue, forecasts suggest it could reach \$1 in the coming years, potentially yielding a 5800% ROI for early buyers. Significant Slowdown in Cardano (ADA) User Growth Cardano's user expansion has plateaued, with the count of ADA wallet addresses static at 4.45 million for nearly a year. Despite the competitive crypto landscape where platforms like Solana are rapidly gaining new users, Cardano's development efforts have significantly diminished, decreasing by 75% in a month. ADA's price has also fallen by nearly 23% over the past 30 days. However, signs like a bullish pennant formation and stabilizing Relative Strength Index (RSI) might hint at a possible upturn, though Cardano currently grapples with challenges from more dynamic rivals. PEPE Price Projections: Possible Climb to \$0.000012? Currently, PEPE trades 38.29% below its highest ever price. Despite the recent drop, it maintains an impressive growth for the year. August 2024 could be pivotal for PEPE's price as it teeters on the edge of rising to \$0.000010. Should the momentum falter, the price may dip to \$0.0000060. Looking forward to the third quarter of 2024, a breakthrough to \$0.000012 is feasible if bullish trends persist, though a bearish trend might lower it to \$0.0000070. BlockDAG's Resilience Amidst Market Turbulence The recent market downturn severely impacted many cryptocurrencies, leaving buyers reeling from the losses. Market downturns are an inevitable part of the crypto landscape, and it's uncertain when the next one might strike. Instead, the key is to identify cryptos that can weather the storm, and here, BlockDAG emerges as a robust choice. Since its first batch, BlockDAG's value has surged by 1680%—a return hard to match. Currently, each BDAG is valued at \$0.0178, and the BlockDAG community now boasts over 100,000 holders spread across more than 30 countries. What sets BlockDAG apart? It's the technology. The unique Block & DAG architecture tackles the significant challenges of speed, security, and decentralization—issues that even well-established giants like Bitcoin and Ethereum face. With transaction speeds reaching between 10,000 to 15,000 transactions per second, BlockDAG is exceptionally fast. Additionally, BlockDAG is revolutionizing the market with its crypto payment card, which functions like a typical debit card, making it possible to use crypto for purchases anywhere. These innovations have propelled BlockDAG to impressive new heights. Following robust presale results and continuous technological advancements, BlockDAG is anticipated to hit \$1 in the coming years. For those considering getting in on batch 22, there's a potential for a 5800%. But hurry—the window is closing fast, as this batch is nearly sold out, with some stakes as high as \$2.4 million already claimed. The Final Call The crypto market is really rough in 2024, and a lot of coins are struggling. Cardano (ADA) is trying hard to pick up speed again, but things aren't looking great as its growth slows and fewer people are working on it. At the same time, PEPE is barely getting by as it tries to deal with these tough market swings. But even with all this chaos, BlockDAG is standing strong. It had a really good presale, bringing in \$68 million, and everyone is starting to notice its strength. Right now, each BDAG coin is worth \$0.0178, and there's a good chance it could go up to \$1 in the coming years. That means people who purchased early in batch 22 could see their money grow by as much as 5800%. However, there's not much time left. This batch is selling out fast, with some big buys up to \$2.4 million. Once it's gone, the next batch will cost more, so now's the best time to get in for a big potential return. Learn About BlockDAG's "Act Now Before Prices Increase": Presale: <https://purchase.blockdag.network> Website: <https://blockdag.network> Telegram: <https://t.me/blockdagnetwork> Discord: <https://discord.gg/Q7BxghMvYu> Disclaimer: TheNewsCrypto does not endorse any content on this page. - Base network surpasses 1M daily active addresses marking a surge in user engagement. - The introduction of Basenames contributes to the significant growth in the network. Base, the Layer 2 blockchain network nurtured by Coinbase, has recently surpassed 1 million daily active addresses. This marks a substantial increase in user engagement with the network growth of about 71% in the past 30 days. On Aug 24, Base recorded 1.05 million active addresses and 1.03 million the next day. This positions Base ahead of other major Layer 2 networks, with more active addresses than all its competitors. For example, Arbitrum, another leading Layer 2 solution, had 394,000 active addresses, while Linea and Mantle had 198,000 and 69,700, respectively. The recent introduction of Basenames, a service that allows users to create personalized on-chain identities on the Base network. It is built on Ethereum Name Service (ENS) and mainly focuses on simplifying the transactions within the ecosystem. Since their inception, over 200,000 Basenames have been minted, with 177,500 owned by unique users. In addition to the success of Basenames, Base has seen significant growth in financial activity. The network now handles over 4.3 million daily transactions. Its daily stablecoin transfer volume has surged to \$4.1 billion, representing a 156% increase week-over-week. Base's Growth Fueled by DEX Surge, and Onchain Summer? Moreover, Base has captured 9.25% of Ethereum's total decentralized exchange (DEX) volume, up from 2.81% in March, showing nearly a 50% growth. Base's transaction costs remain low, with median costs at just \$0.002, further contributing to its attractiveness to users. The network's total value locked (TVL) has also increased by 7.3% in ETH terms over the past 30 days, reaching \$6.46 billion. This puts Base second to Arbitrum in terms of TVL, highlighting its rapid climb in the Ethereum Layer 2 landscape. The spike in the network coincided with the onchain Summer campaign, Base's ongoing project that promotes development on the platform. It was introduced in 2023 to boost its Layer-2 network adoption and the event has turned out to be a hit. The growth of Base's ecosystem, driven by innovations like Basenames and increasing DEX activity, signals a bright future for the network as it continues to expand and attract a diverse user base. Highlighted Crypto News Today: Will Solana Whales' Activity Drive It Above \$200?

- The UAE has made an urgent request for consular assistance following the arrest of the Telegram founder. - Pavel Durov is garnering public support including tech leaders like Elon Musk and Paul Graham. The United Arab Emirates has requested the French government to provide Telegram founder Pavel Durov with all consular services urgently following his arrest in Paris. The Ministry of Foreign Affairs stated, "We are caring for citizens, preserving their interests, following up on their affairs, and providing them with all the aspects of care are a top priority for the UAE." Pavel Durov, a UAE citizen was recently detained at Le Bourget airport in Paris by French authorities when he got off the private plane on the evening of August 24. He was included in the French wanted list and got detained unexpectedly. The French authorities allege that the Telegram platform refused to cooperate with the country's regulations. The French media has reported that Durov was detained due to alleged issues with Telegram's content moderation. They claimed that his messaging app Telegram was used for money laundering, drug trafficking, and other offenses. Emmanuel Macron, the President of France has made an official tweet on X stating that this arrest was not a political move of France. He says that France is a country that is deeply committed to freedom of expression and communication. And he said that, "It is up to the judiciary, in full independence, to enforce the law." Pavel Durov is Gaining People's Support The arrest has caused controversy among people and officials. Many

Tech leaders have voiced their opinions on his arrest. From Elon Musk to Paul Graham, several figures have expressed their concerns over the attack. #FREEDUROV has been trending for the last two days. Many people see this as an action that undermines the right to privacy and freedom of speech. The exact charges are still unclear. Pavel has also been vocal about government interference within Telegram on multiple occasions. He said that the FBI is trying to infiltrate Telegram by hiring an engineer to create a backdoor for accessing user data, which Telegram opposes for private reasons. Highlighted Crypto News Today: Will Solana Whales' Activity Drive It Above \$200?

- Fractal Bitcoin's mainnet is launching on September 9, enhancing scalability. - 80% of Fractal tokens will go to the community, focusing on decentralization. Fractal Bitcoin, a scaling solution, is gearing up for the official launch of its mainnet on September 9. This development marks a significant milestone for the project as it seeks to enhance Bitcoin's scalability and usability. The team recently shared this news via an update on X, drawing attention from the wider crypto community. Fractal Bitcoin also revealed key information regarding its native token, Fractal. However, the total supply remains undisclosed. The tokenomics suggest that 80% of the total supply will be distributed to the community. The remaining 20% will be allocated to the project's team and contributors. This allocation emphasizes a strong community focus, which could drive user engagement as the project advances. In addition to the mainnet launch, Fractal Bitcoin plans to roll out its decentralized exchange (DEX), PizzaSwap, previously known as the Fractal Swap. According to the team, PizzaSwap will be available on the testnet later this week. This testnet launch is expected to provide users with the opportunity to experiment with the platform before its full integration with the mainnet. The introduction of PizzaSwap further strengthens the ecosystem by enabling users to swap tokens seamlessly within the Fractal network. Bitcoin Price Weekly Overview Over the past week, Bitcoin (BTC) experienced a modest but noteworthy gain. Starting from a low of around \$61,170 on August 21, BTC showed a strong rebound mid-week, reaching highs near \$65,000 before cooling off. The significant rise to \$65,000 was driven by increasing trading volumes and positive market sentiment, as indicated by a 51.43% surge in 24-hour volume to \$28.38 billion. The key resistance stands near \$65,000, where Bitcoin faced rejection mid-week after its rally. The nearest key support for Bitcoin stands around \$62,500, which aligns with the consolidation seen earlier in the week. The RSI on the daily chart hovered near the neutral zone at 48.77, suggesting that Bitcoin is neither overbought nor oversold. Highlighted Crypto News Today

- The U.S. SEC has charged the Adam brothers with orchestrating a \$60M crypto Ponzi. - The brothers promised 13.5% monthly returns to the investors. The United States Securities and Exchange Commission (SEC) has initiated legal action against two brothers, alleging their involvement in orchestrating a \$60 million Ponzi scheme with a non-existent crypto trading bot. The SEC has filed a complaint in the US District Court for the Northern District of Georgia, Atlanta, against two brothers "Jonathan Adam and Tanner Adam" and their entities, GCZ Global LLC and Triten Financial Group LLC. According to the regulator's lawsuit, they "have deceived over 80 people by promising 13.5% monthly returns from a fake crypto bot." Justin C. Jeffries, Associate Director of Enforcement at the SEC, stated: "As we allege, the Adam brothers promised their investors high returns on a crypto investment that did not exist and then used investor funds to make Ponzi-like payments and to purchase designer goods, recreational vehicles, and million-dollar homes." Notably, the brothers convinced investors that their funds are to be wired to a crypto platform, Kraken. Investors were also told that the crypto bot was functioning on a trading platform, pinpointing arbitrage trading opportunities. Further, they have promised that the funds will be used in a lending pool to flash loans through smart contracts to execute the arbitrage trades. How Did Adam Brothers Spend the Funds? The brothers used new investments to pay returns to earlier investors instead of generating profits and spent funds on luxuries for themselves. Moreover, they mispent \$53.9 million on a lavish lifestyle, including purchasing luxury cars, recreational trucks, and vehicles for \$480,000. Also constructing a \$30 million Miami condominium. Additionally, the brothers have used \$1.8 million of investor funds to build houses for their parents and in-laws. Notably, the investors received only a fraction of their investments in return. The most of the money went to make Ponzi-like payments and for the brothers' extravagant expenditures. In response to these allegations, the SEC has secured emergency asset freezes for the defendants and their entities. Otherwise, the government agency is seeking permanent restraining orders against their companies, forfeiture of all funds acquired, and civil fines to hold Adams accountable for their fraudulent activities. - DOGS meme coin recorded a price drop of over 39% within 24 hours, falling from \$0.001856 to \$0.001129. - The major exchanges Binance, OKX, and Bybit listed the meme coin. DOGS, a new Telegram-native meme coin launched on August 26, 2024, dropped sharply in value despite gaining significant attention in the crypto community. Over the last 24 hours, the token saw its price tumble more than 39%, falling from a peak of \$0.001856 to a low of \$0.001129. This downturn followed closely after the coin was listed on major centralized exchanges such as Binance, OKX, and Bybit. Despite an initial surge in interest, the token's value dropped by 25% within hours of its listing, which was strategically timed to coincide with International Dog Day on August 26, 2024. At the time of writing, DOGS traded at \$0.001274 with a market cap of \$672 million. DOGS Meme Coin Faces High Volume and Selling Pressure Since August 23, 2024, DOGS has created a buzz after becoming available on Binance's Launchpool. Users staked BNB and FDUSD to earn DOGS rewards. This led to a high level of anticipation about the token's exchange listing. Upon its market debut, DOGS recorded an impressive trading volume exceeding \$2.17 billion, ranking it as the 7th highest among all cryptocurrencies. This reflects the strong initial interest from traders and investors in the meme coin. However, the anticipated surge in DOGS' prices did not happen as expected. In a significant Token Generation Event (TGE), 502.48 billion DOGS tokens were released, accounting for 91.4% of the total supply. This release added to the selling pressure and led to the price drop. Further, analysts suggest that if this trend continues, the price could potentially fall another 20%, testing support levels as low as \$0.0009. However, according to the DOGS price chart, the sharp decline appears to be slowing. If DOGS can maintain a price above the \$0.001 support level, there could be a recovery, with possible upward targets of \$0.0032 or even \$0.005 for optimistic buyers. Highlighted News Of The Day

UPLINK is thrilled to announce a significant milestone in its journey, with over 25 million registered users and 10 million holders on the Arbitrum network. This remarkable achievement is a testament to the strength and engagement of our global community. The rapid growth of UPLINK can be attributed to the transformative nature of Web3 social compared to traditional Web2 social platforms. In the Web3 landscape, users' social graphs are secured on the blockchain, ensuring data ownership and independence from external authorities. As part of its ongoing commitment to expanding its ecosystem, UPLINK is pleased to support the @MantleEco network and will soon extend its support to @berachain. The UPLINK Social Growth Layer, a key component of our roadmap, is designed to facilitate seamless integration across various blockchain environments. This includes both EVM-compatible chains (such as Ethereum, Mantle, and Arbitrum) and non-EVM chains (like Ton and Solana), empowering developers to create Web3 applications with the ease and efficiency of Web2 technologies. "We are excited to partner with our ecosystem collaborators to onboard millions of Web2 users to the Web3 space," said Eric at UPLINK. "Our mission is to bridge the gap between traditional and decentralized platforms, driving innovation and growth across the digital landscape." For more information about UPLINK and its initiatives, please visit <https://www.uplink.io> Contact: - UPLINK - admin@uplink.io Media Contact - Rachita Chettri - Contact@mediax.agency About UPLINK: UPLINK is a leading provider of blockchain solutions designed to simplify the development and deployment of Web3 applications. By offering a comprehensive chain abstraction stack, UPLINK supports a broad range of blockchain environments, fostering innovation and connectivity within the Web3 ecosystem. - Friday's net influx of \$252 million was the greatest net inflow since July 22. - Without surprise, BlackRock's IBIT continued to dominate the other funds. With the continuation of a seven-day string of positive inflows on Friday, the aggregate value of the spot bitcoin exchange-traded funds in the US hit its highest point so far in August, at around \$58.4 billion. In addition, according to statistics from SoSoValue, Friday's net influx of \$252 million was the greatest net inflow since July 22, 32 days ago. And the highest net inflow since the streak started as well. Without surprise, BlackRock's IBIT, the biggest spot bitcoin ETF by total asset value, continued to dominate the other funds. With the greatest net inflow of \$87 million, some of the highest inflows since July 22, IBIT's net inflow was \$54.1 billion. Friday's net inflow was the only fund to record an outflow of \$35 million, Grayscale's GBTC, the second-largest ETF by asset value, saw \$50 million inflow into its Bitcoin Mini Trust (BTC). Investments of \$42 million were received by Bitwise's BITB, \$24 million by Ark and 21Shares' ARKB, and \$14 million by VanEck's HDL. Among the remaining funds, only BCO (Invesco) and BRRR (Valkyrie) had inflows of \$3 million and \$2 million, respectively. Spot Ether ETFs Struggle At the same time as bitcoin ETFs have been gaining for seven days in a row, spot ether ETFs have been losing money. A further \$5.7 million was removed from the funds on Friday, increasing the total amount removed since the streak started on August 15th to roughly \$99 million. Despite a negative total due to a \$9.8 million outflow from Grayscale's ETHE on Friday, ETHV (VanEck) and ETHW (Bitwise) both had \$2.0 million and \$1.4 million in inflows, respectively. The other funds did not see a substantial shift in assets, whereas Fidelity's FETH logged almost \$700,000. Highlighted Crypto News Today: Fed Rate Cut Speculation Surges as Investors Await Key Inflation Data

- Buterin stressed in a tweet that no execution client has a market share more than two thirds. - The network may be jeopardized if only one execution client reaches 66.6% market share. Ethereum co-founder Vitalik Buterin has lately brought attention to a crucial part of the network's resilience. He called it "great news" for the Layer 1 network since the percentage of execution clients doesn't go beyond two-thirds. In addition, the Ethereum blockchain has recently undergone significant modifications, and this announcement follows suit. Buterin stressed in a tweet that no execution client has a market share more than two thirds. That the Ethereum L1 is so strong is fantastic news. This declaration highlights the robustness of the ether network in the face of threats that may result from a single client controlling a disproportionate amount of the network. No client can provide some background, the term supermajority describes the dangers that may arise if one client controls the whole network. The stability and security of the network may be jeopardized if only one execution client reaches 66.6% market share. The good news for the ETH community is that no client now has more than this level, as seen in the snapshot supplied by Vitalik Buterin. No one client dominates the network, as seen by the numbers, which point to a diversified ecosystem. This helps with Layer 1 scalability and reduces the possibility of a supermajority, as shown by Vitalik Buterin. Not only that, but Ethereum is also about to get some major upgrades, including the much awaited Pectra upgrade. According to Christine Kim of Galaxy Research, the 140th All Core Developer Consensus Conference Call (ACDC) was recently convened by the EtherCast developers to discuss this upcoming improvement. A new upgrade dubbed Fulu-Osaka has been hinted to by Ethereum developers, according to Kim. The network's speed and security will be significantly improved with this upgrade. Highlighted Crypto News Today:

- Bitcoin's price has surged 6.79% from a low of \$60,719 to a high of \$64,947. - Federal Reserve Chairman Jerome Powell's indication of potential rate cuts has boosted the crypto market. In the latest crypto market update, Bitcoin has surged past \$65,000 following signals from Federal Reserve Chairman Jerome Powell that rate cuts may be on the horizon. Powell's comments on cooling inflation and concerns about labor market weakness have fueled optimism among investors, pushing Bitcoin's price up by over 6.79% from a low of \$60,719 to a high of \$64,947 within the past 24 hours. Ethereum and Solana also saw significant gains, rising 3.16% to \$2,758 and 6.97% to \$154, respectively. The positive momentum was further boosted by the support of Donald Trump by crypto-friendly RFK Jr., despite Kennedy's exit from the presidential race. Bitcoin Current Technical Analysis At the time of writing, Bitcoin traded at \$64,280 with a market cap of \$1.27 trillion. Additionally, the daily trading volume has soared over 67.37% to \$43.21 billion. Technical indicators and market patterns support Bitcoin's recent bullish trend. The cryptocurrency has recently broken out of a key price pattern, with a golden cross suggesting potential further gains. Further, on-chain analyst Ali predicts that Bitcoin could test \$66,250 in the near future, following a recent prediction that it would reach \$64,045. The price chart reveals an inverse head-and-shoulders pattern, a common bullish signal, with Bitcoin breaking above the neckline at \$63,500. The current price stands above the 23.36 Fibonacci retracement level, with a target near \$67,350, indicating a potential increase of about 9.75% from the breakout level of \$61,795. The 21-day EMA is below the current price, indicating that the recent price levels are higher than the average price over the past 21 days. While the 21-day EMA confirms the breakout with a bullish crossover, the RSI is in overbought territory at 72.93. This suggests that the price may have risen too quickly and could face a potential pullback or consolidation soon, despite the overall bullish signal from the EMA crossover. Further, the MACD shows a bullish trend. The MACD's positive momentum reinforces the likelihood of continued upward movement. However, there are signs of weakening momentum, and resistance is noted near \$66,000, which may impact further price movement. Bitcoin's crucial support is at \$60,000, with resistance

between \$64,250 and \$65,500. Highlighted Crypto News Today Tether Helps Law Enforcement Recover Over \$108.8M in Illicit USD

- RFK's views left an impression on the crypto world, and his campaign was well-publicized. The pairing of the two leading candidates might cause some trouble for Kamala Harris. In a court filing, Robert F. Kennedy (RFK) Jr., a politician who has been vocal in his support for Bitcoin and who ran for president before, confirmed that he would back Donald Trump. The court filing officially confirmed what many political analysts had suspected all along, and they had been watching the campaign closely. Robert Kennedy Jr. willingly withdrew his candidacy for president. His announcement that he would be endorsing former US President Trump will be made around twenty-four hours after he withdraws from the contest. In addition to RFK Jr.'s running mate Nicole Shanahan's approval, the court document hinted at an indirect endorsement. Both candidates for president want to use rallies in Arizona to announce their formal endorsements. Crypto Playing Pivotal Role Moreover, RFK's views left an impression on the crypto world, and his campaign was well-publicized. Also, at the Bitcoin Conference 2024, he revealed his intentions to keep a sizable reserve. Cardano founder Charles Hoskinson endorsed him, even though the crypto community was heavily biased toward Donald Trump. For Vice President Kamala Harris, the pairing of the two leading candidates might cause some trouble. Focus may move away from Harris's team after this endorsement announcement after a buzzy Democratic National Convention (DNC). All of the candidates running for president are making tremendous efforts to attract voters' attention. Furthermore, in the upcoming election, cryptocurrency will play a pivotal role. The frontrunner is obvious, even though all parties are working to win over influential entrepreneurs with their proposals. - In Q2, the five Bitcoin miners that JPMorgan keeps tabs on mined 5,854 Bitcoin. - Some miners are shifting their computational power from Bitcoin mining to AI projects. A recent research from JPMorgan states that Bitcoin miners are finding it difficult to maintain profit due to the April halving of the Bitcoin network and increasing power prices. According to a report written by analysts Reginald Smith and Charles Pearce, the Q2 of 2023 was a historic quarter for Bitcoin miners. They had to deal with the 4th Bitcoin halving event, which cut the daily BTC mining opportunity in half. Which resulted in lower margins and profitability. In the halving event that occurred on April 20, the Bitcoin network cut mining payouts in half, from 6.25 BTC every 210,000 blocks to 3.125 BTC. Since then, Bitcoin miners have been struggling to catch up. Shifting Computational Power to AI Projects JPMorgan noted that cash-rich miners such as Riot Platforms and CleanSpark have been acquiring other miners with turn-key facilities in order to boost their power pipeline and raise their near-term hashrate. Miners with little cash, such as IREN and Cipher, prioritized acquiring greenfield possibilities because of the lower capital requirements. In Q2, the five Bitcoin miners that JPMorgan keeps tabs on mined 5,854 Bitcoin, a decrease of 28% compared to the previous quarter. It was reported that Marathon Digital Holdings earned 2,056 BTC, maintaining its lead in the amount of Bitcoins mined. In the meanwhile, CleanSpark increased its market share in Q2 thanks to \$231 million in capital expenditures. It earned almost 27% of all covered miners' Q2 revenues, according to the research. According to the research, in order to meet the increasing needs of the sector, the five miners issued around \$1.2 billion worth of stock. In the wake of the halving, some miners are shifting their computational power from Bitcoin mining to AI projects. Highlighted Crypto News Today: Coinbase Enhances Stablecoin Offering with EURC Integration on Solana

- Jerome Powell said that interest rate reductions are in the works. - The market's expectation is that the Fed will decrease interest rates by 100 bps this year. The most powerful indication of Fed rate reduction came from US Federal Reserve Chair Jerome Powell during his Friday address in Jackson Hole. Following the recent publication of the FOMC Minutes, the stock and cryptocurrency markets were already in a bullish mood. But Powell's statement that "the time has come for policy to adjust" further elevated it. A dramatic increase was seen by the prices of both Bitcoin and Ethereum. Following the dovish remarks, which hinted at possible rate cuts beginning in September, the price of bitcoin reached an intraday high of \$62,320. The price of Ethereum also reached \$2700. But the gain was short-lived, as the price subsequently went back down to \$2,680. Rate Cut in September Highly Likely Chair of the US Federal Reserve Jerome Powell said that interest rate reductions are in the works at the Jackson Hole Symposium in Wyoming. Powell acknowledged that a change in monetary policy is necessary in light of declining inflation. And a weaker labor market, but he did not provide specifics about when or how much rates would be decreased. As anticipated, the Chair of the Federal Reserve said that new data, the changing outlook, and the risk balance would determine the timing and amount of rate decreases. Stocks, bonds, and Bitcoin all rallied after this, as it reaffirmed predictions of a September rate decrease. After being at 76% yesterday, the CME FedWatch tool now forecasts a 67.5% chance of a 25 bps rate drop in September. The market's expectation is that the Fed will decrease interest rates by 100 basis points this year. The US dollar index (DXY) and US Treasury rates hit a 14-month low, which bodes well for Bitcoin. - Exhibition space sold out a record month ahead of the world's largest crypto event - Speaker highlights include Binance CEO Richard Teng; Solana Founder Anatoly Yakovenko; Oracle Red Bull Racing Formula 1 driver Max Verstappen; Grammy nominee Iggy Azalea; Blueprint Founder Bryan Johnson; prolific entrepreneur Balaji Srinivasan; whistleblower Edward Snowden; and many more - TOKEN2049's debut startup competition NEXUS issues final call for innovative early-stage Web3 projects to compete on the world stage, following hundreds of applications TOKEN2049, the world's largest crypto event, is set to make history again by shattering all previous records for its 2024 edition. Taking place September 18-19 at the Marina Bay Sands ahead of the Formula 1 Singapore Grand Prix 2024 race weekend, TOKEN2049 Singapore will host 20,000 attendees from over 150 countries, solidifying its status as the premier global gathering across the Web3 ecosystem. With all exhibition opportunities sold out in record time, attendees are strongly advised to secure their tickets promptly before they sell out. Following the overwhelming demand seen at TOKEN2049 Dubai in April, where tickets sold out weeks before the event, TOKEN2049 Singapore is on track for another full-capacity conference. Formula 1 World Champions, pop culture icons, founders and CEOs across Web3, AI, finance and technology dominate an exceptional, expanded speaker lineup at TOKEN2049 Singapore. New additions include Oracle Red Bull Racing Formula 1 driver Max Verstappen, Grammy-nominated artist Iggy Azalea and Blueprint Founder Bryan Johnson. They join previously announced speakers such as Binance CEO Richard Teng, Solana Founder Anatoly Yakovenko, whistleblower Edward Snowden, prolific entrepreneur Balaji Srinivasan and many more. Alex Fiskum, Co-Founder of TOKEN2049, commented: "We're excited to be hosting the largest crypto event of the year. With more than double the attendees from last year and a significantly expanded event space at the iconic Marina Bay Sands, all exhibition opportunities have sold out a record month in advance. We're expecting 20,000 attendees, and with tickets moving fast, we're on track to sell out well ahead of the event. We look forward to welcoming the global crypto community to Singapore next month for our most dynamic and immersive TOKEN2049 experience yet." Renowned angel investor and entrepreneur Balaji Srinivasan added: "TOKEN2049 is the largest crypto conference in the world, and it's held in Singapore. It will be updating everyone at the event on our new Network School at ns.com. A new highlight of this year's event is NEXUS, TOKEN2049's debut startup competition. The premier platform issues a final call for ambitious early-stage crypto projects to compete on a global stage. Selected participants will vie to impress thousands of attendees and a judging panel of foremost venture capitalists, as they journey to become the next crypto unicorn. TOKEN2049 Singapore's title sponsors include OKX, a leading crypto exchange and Web3 technology company; BingX, a leading crypto exchange and official partner of Chelsea FC; TRON DAO, empowering decentralised commerce and community for every human on the planet; DWF Labs, the new generation Web3 investor and market maker; Bitget, the world's leading cryptocurrency exchange and Web3 company; Bullish, one of the fastest-growing, regulated digital asset exchanges, and Zeebu, the Web3 neobank tailor-made for telecom settlements. TOKEN2049 Singapore promises an unparalleled experience that transforms the entire city-state into a hub of innovation and networking. TOKEN2049 week will feature over 500 side events from September 16-22, ensuring a jam-packed week filled with opportunities for connection and collaboration. For more information and to purchase tickets before they sell out, visit: <https://www.asia.token2049.com/> PR Newswire is a community partner of TOKEN2049 Singapore. ### Alex Fiskum, Co-Founder of TOKEN2049 is available for interview. The full list of TOKEN2049 Singapore speakers can be found here. ABOUT TOKEN2049 TOKEN2049 is a global Web3 event series, organised semi-annually in Singapore and Dubai, where decision-makers in the global crypto ecosystem connect to exchange ideas, network, and shape the industry. TOKEN2049 is the preeminent meeting place for entrepreneurs, institutions, industry insiders, investors, builders, and those with a strong interest in the crypto and blockchain industry. - The FBI will use NFTs to notify victims of the CluCoin crypto fraud scheme. - This marks the first time NFTs are used in this way by law enforcement. The Federal Bureau of Investigation (FBI) is taking an innovative approach to reach victims of crypto fraud. The agency plans to use Non-Fungible Tokens (NFTs) to notify victims of a Miami-based crypto scheme called CluCoin. The FBI aims to distribute approximately \$1.14 million back to the victims. This represents one of the first instances where NFTs are used for such a purpose by a law enforcement agency. The CluCoin project, launched by Austin Michael Taylor, promised investors significant returns. However, the founder misused the funds. Taylor diverted the investment to fund his online gambling activities instead. On August 15, he admitted to wire fraud, confirming the misuse of investor money. Direct Notification via NFTs Victims identified by the FBI will receive NFTs as a form of notification. Each NFT will contain details on how victims can claim their restitution. The U.S. Attorney's Office has urged anyone who thinks they were defrauded to share relevant information with the FBI. This unique use of blockchain technology allows the FBI to reach victims directly and securely. Additionally, this method aligns with the decentralized nature of cryptocurrencies, ensuring that communication remains tamper-proof. By leveraging NFTs, the FBI can ensure transparency and trust in the restitution process. This step may set a precedent for other law enforcement agencies in dealing with crypto-related crimes. However, there are challenges associated with this method. Not all victims may be familiar with NFTs or how to access them. Thus, the FBI will need to provide clear instructions and support to ensure that all affected parties can easily retrieve their funds. As the agency moves forward with this plan, it may also need to address potential concerns about the security and accessibility of NFTs. By adopting this digital approach, the agency aims to simplify restitution and ensure timely compensation for victims. Highlighted Crypto News Today PayPal Launches Interest Rewards Program for PYUSD Stablecoin Holders

- SunWukong's price surge was triggered by Justin Sun's involvement. - Market analysts warn of potential volatility despite the current hype. In the volatile nature of the cryptocurrency market, an anonymous trader has turned a modest \$1,000 investment into a jaw-dropping \$750,000 by trading the SunWukong memecoin. The trader's holdings in SunWukong surged to this impressive peak, yet he has not sold a single token, leaving the crypto community speculating about his future strategy. This success story highlights the high-risk, high reward, landscape of memecoins, where fortunes can change rapidly. Launched on the Tron blockchain, SunWukong, inspired by the popular game Black Myth: Wukong, has gained significant traction since its inception. The token's price skyrocketed, capturing the attention of both retail and institutional investors alike. According to Arkham Intelligence, the trader acquired 43.8 million SunWukong tokens for an initial investment of \$997. SunWukong memecoin's value surged after Tron founder Justin Sun changed his X profile picture to SunWukong, a character from the new game Black Myth: Wukong. This meteoric rise in SunWukong's value also had a ripple effect across the Tron ecosystem. While the anonymous trader's success story is inspiring, it also warns potential investors: what goes up may come down. Market Impact and Future Outlook The surge of SunWukong also sparked interest in related Tron-based projects. Justin Sun launched SunPump on August 13 as a rival to Solana's Pump.fun. Since its debut in January this year, pump.fun has amassed an impressive \$95 million in revenue. Remarkably, within just eight days, SunPump has already earned over \$1 million in revenue, quickly establishing itself as a notable memecoin deployer on the Tron network. Despite the current hype surrounding SunWukong, market analysts caution against over-optimism. According to CoinMarketCap, Sun Wukong shows fluctuating prices, indicative of the broader instability within the memecoin space. While the anonymous trader's success story is inspiring, it also warns potential investors: what goes up may come down. Highlighted Crypto News Today Binance CEO Declines IPO or Fund Raising Needs Amid Regulatory Focus

- Binance CEO states that the exchange is in a good financial shape and doesn't need an IPO. - The exchange has witnessed several regulatory hassles in the past few months. Binance, one of the leading crypto exchanges, is currently being scrutinized internationally by regulators. However, the institution is not alone in its struggle as other leading firms such as Coinbase and Ripple have also faced challenges on the regulations front. Meanwhile, the crypto exchange despite the struggles has reported several advancements. Notably, in a recent CoinDesk interview, the current CEO Richard Teng discussed Binance's financial strengths and stated that the exchange might not need an IPO. He said Binance was in

good financial shape, not requiring fund-raising or the aforementioned Initial Public Offerings. Moreover, he said that Binance had shown profits since the fifth month of its operations. Additionally, the CEO also applauded Binance's mindful spending which has resulted in the current financial status. He also discussed that the company is attempting to become more transparent in its spending procedures in the interview. Notably, the CEO has spoken to several leading news media this week. He has outlined long-term plans for the exchange. Richard Teng discussed various strategies including global expansion plans in his interviews. Separately, the exchange was seen announcing plans for a major hiring of employees. Amid these advancement announcements, Binance has encountered several lawsuits and other complications from national organizations in the past months. How is Binance Combating Regulatory Complications? In the last seven days, Binance has faced a new lawsuit in the USA. The lawsuit filed by crypto investors targets the exchange and its former CEO Chengpeng Zhao. Meanwhile, the Indian government recently charged the exchange with GST fees for the past few years. This required the exchange to pay a fee of 780 crores INR worth \$80 million. On the other hand, Binance Executive Tigran Gambaryan is still detained by the Nigerian government on money laundering and non-compliance issues. Despite several lawsuits, Binance remains one of the leading exchanges holding prominence among users. Similarly, other aforementioned institutions like Ripple and Coinbase have also not withheld advancements within their ecosystems amid lawsuits. Highlighted Crypto News Today: Hackers Compromise McDonald's Instagram to Promote Solana Meme Coin

- SunPump, the Tron memecoin deployer reached \$1 million in revenue. - Tron has generated \$3.8M in revenue in the past 24 hours. Justin Sun, the founder of Tron, launched SunPump on August 13, positioning it as a competitor to Solana's Pump.fun token generator. In just eight days since its debut, SunPump has generated over \$1 million in revenue. As a memecoin deployer on the Tron network, SunPump has quickly gained traction, earning an impressive over \$1 million in revenue within just a few days of its launch. One of the key factors contributing to SunPump's success is the low gas fee on the Tron network. In an official tweet, Justin Sun announced that the transaction fees for both Tron and SunPump have been reduced by 90%, with the fee now standing at just \$0.352 per transaction. The Tron blockchain has long been a hub for meme-inspired cryptocurrencies, and SunPump has capitalized on this trend. The platform's strategic focus on the Tron blockchain has allowed it to capitalize on the network's growing popularity and robust ecosystem. As more investors and developers turn to Tron, SunPump has positioned itself as a go-to solution for memecoin deployment. Tron Recorded an ATH of 7.99M Transactions Tron maintained an average of 7.99 million transactions per day with over 8 billion transactions. The network recorded more revenue than Ethereum and a few other major networks. It collected \$434 million in fees. The Tron-based memecoins have led the price of TRX to hit a three-year high of \$0.1656. The network generated over \$3.8 million in revenue in the past 24 hours. Since the launch of SunPump, 4844 memecoins have been created on the Tron network. This has brought in a revenue of \$1.84M. Additionally, \$18 USDT was minted on the Tron network, recently by USDT issuer Tether. Highlighted Crypto News Today:

- Binance faces a new lawsuit for allegedly enabling money laundering. - The lawsuit accuses Binance of prioritizing profits over legal compliance, labeling them as "Crypto-Wash". Binance and its former CEO, Changpeng Zhao (CZ), are facing a new class action lawsuit filed by three crypto investors. The lawsuit alleges that the exchange failed to protect its money laundering, which is under the jurisdiction of the Western District of Washington, Seattle, on August 18. The plaintiffs accuse Binance of prioritizing profits over legal obligations. They also claimed the platform facilitated bad actors in making their funds untraceable, thereby shielding them from authorities. Moreover, the lawsuit alleges that Binance was a depository for ill-gotten gains obtained through hacks, thefts, malware, and ransomware attacks. The suit describes Binance as the "Crypto-Wash Empire," asserting that the exchange maximized its revenue with the assistance of criminals, thieves, and sanctioned users. Meanwhile, Bill Hughes, Senior Counsel and Director of Global Regulatory Matters at Ethereum development firm Consensus, weighed in on the situation. In an August 20 post on X, Hughes described the lawsuit as a "natural, predictable follow-on civil action." And that it aimed at capitalizing on government prosecutions. However, he also noted that the lawsuit places Binance in a "tough position." And warned that it could have significant implications for the crypto industry if it goes into trial. As this case goes far into discovery and even to dispositive pre-trial motions, then the efficacy of blockchain analytics itself and on-chain asset recovery will be on trial," Hughes stated. He added that the lawsuit could put Binance in a difficult spot regarding what it might be incentivized to reveal about tracing and recovery. Binance And Its Legal Troubles This latest lawsuit adds to Binance's mounting legal troubles. In November 2023, CZ pleaded guilty to violating U.S. money laundering laws. And resigned as CEO as part of a settlement that included a \$4.3 billion fine. Additionally, the SEC filed a suit against Binance in June 2023, accusing the exchange of misleading practices. And artificially inflating trading volumes. Highlighted News Of The Day Ethereum (ETH) Supply in Profit Drops to Lowest Since November 2023

- Metaplanet's stock price surged more than 13% and finished Tuesday at 10.87%. - The company's Bitcoin holdings have now reached 360.368 BTC. As part of its most recent Bitcoin investment strategy, the publicly traded Japanese company Metaplanet has acquired bitcoins valued at 500 million Japanese yen. In the wake of chief executive officer Simon Gerovich's announcement of Metaplanet's second Bitcoin acquisition, the stock price surged more than 13% and finished Tuesday at 10.87%. Metaplanet Inc. said on August 20 that it had increased its balance sheet by 57.273 BTC, which is equivalent to 500 million Japanese yen (\$3.39 million). The average price per Bitcoin that the corporation paid for them was \$59,317. Banking on Bitcoin Moreover, the company's Bitcoin holdings have now reached 360.368 BTC, according to Simon Gerovich. At an average price of 9,573,556 yen per Bitcoin, the firm referred to as Japan's MicroStrategy paid 3.45 billion Japanese yen to buy them. The stock price of Metaplanet rose today as a result of this. Metaplanet reported last week that they had purchased 57.103 Bitcoins, for a total of 500 million Yen, or \$3.3 million. The average price per Bitcoin that the corporation paid was 8,756,107 yen. A loan of 1 billion Japanese yen was taken out by the corporation at an interest rate of just 0.1%. The corporation is able to purchase additional bitcoins using loans because of the cheap interest rates in Japan. To put it simply, it's the optimal application of Japanese yen carry trades, which include borrowing yen at lower rates and investing them in global assets with high yields. After the corporation added Bitcoin to its balance sheet, the share price kept going up. The aggressive BTC purchasing strategy has caused the Tokyo stock exchange-listed firm's stock to rally more than 64% year to date. Highlighted Crypto News Today:

- Base is launching its native ENS subnames "Basenames" through a Dutch auction. - The initial pricing is at 100 ETH, descending to 0.39 ETH over a 36-hour timeframe. Coinbase-developed Ethereum L2, Base, transforms Ethereum interactions with its new feature, Basenames, launching today. Integrating with the Ethereum Names Service (ENS) infrastructure, Basenames emerged as a "onchain building block that enables anyone to establish their identity on Base." The strategy for launching Basenames involves the Dutch auction mechanism for users to claim and purchase. The initial pricing is set to a premium fee of 100 ETH and gradually descends to 0.39 ETH over a 36-hour timeframe. This approach to pricing ensures users have an equal opportunity to secure the name they want. Reportedly, no premium fee will be charged post-auction. However, at present, users can only claim one basename per wallet for early access. Generally, the ENS subdomains allow users to create multiple ENS identities under an existing domain within the Ethereum ecosystem. It is similar to the subdomains function on the websites. Networks such as Polygon, Solana, Arbitrum One, and BNB Chain host their web3 usernames through domain infrastructure providers such as Unstoppable domains and Space ID. Base Leads ETH L2 Transactions Hit ATH Ethereum layer-2 networks recorded 12.52 million transactions on August 13, setting a new all-time high (ATH). This marks a remarkable increase from the previous ATH of 11.5 million transactions set on April 4. The market activity surge is primarily due to Coinbase's Base and Arbitrum One. The Base network has accounted for a significant 3.98 million transactions on the ATH day. As a new entrant into the Ethereum ecosystem, Base's performance is notable. Meanwhile, it was followed by Arbitrum One with 1.79 million transactions. Notably, Base and Arbitrum One were the only networks to record transactions above the 1 million mark that day. Moreover, Base leads with 3.25 million weekly active addresses, with 9.1% of its activity involved with cross-chain transactions. And Arbitrum comes with 1.11 million weekly active addresses. - Ethereum has climbed 4% from a low of \$2,566 to a high of \$2,695. - Ethereum's fees hit a five-year low due to rising memecoins and the Dencun upgrade. In the last 24 hours, the Ethereum (ETH) price has climbed over 4%, rising from a low of \$2,566 to a high of \$2,695, which has sparked optimism among investors. After a week of consolidation, the second-largest cryptocurrency finally broke through the \$2,500 resistance zone. At the time of writing, Ethereum is trading at \$2,644, with a market capitalization of \$320 billion. Additionally, the daily trading volume has seen an 18% increase, reaching \$12.22 billion, indicating renewed interest in the market. Ethereum shows signs of entering a bullish trend with the ongoing conversation around the network, which has seen a sharp decline in transaction fees. Experts believe the recent sharp drop in Ethereum network transaction fees to a new record low could be a bullish sign for Ethereum's price. Fees have fallen to 0.6 Gwei (about three cents), down over 95% since March. This significant decrease, the lowest in five years, is partly due to the growing popularity of memecoins on blockchains like Solana and the long-awaited Dencun upgrade, which has improved network efficiency and reduced gas fees. However, the drop in transaction fees to 0.6 Gwei raises questions about its impact on Ethereum's supply. Lower fees mean less ETH is being burned, which could eventually lead to an increase in the circulating supply. While this is favorable for users, it presents a shading challenge for Ethereum as an asset. Ethereum's Price Action and Technical Indicators According to the daily price chart, Ethereum remains above the \$2,600 support level but has fluctuated within a range of \$2,500 to \$2,800 over the past week. Although there's optimism for a rally, the risks of a downturn persist, potentially pushing the price down to \$2,300 before any significant recovery. In a bullish outlook, traders are likely to keep their long positions open as long as the Moving Average Convergence Divergence (MACD) indicator continues to signal a buy. If the MACD moves closer to the neutral zone, these traders may increase their exposure to Ethereum, anticipating a potential bullish reversal if the indicator enters positive territory. Adding to this cautious optimism is the fact that Ethereum's price is currently above the 21-day Simple Moving Average (SMA) on the hourly chart for the ETH/USDT trading pair. A strong rebound that pushes the price above the \$2,800 and \$3,000 levels could potentially trigger a larger rally, with the possibility of ETH aiming for the \$4,000 mark and even challenging its all-time high (ATH). The broader crypto market, particularly the top 10 cryptocurrencies, has also performed well since the start of the week.

- Bitcoin price surpassed the \$60K level yet again in the last 24 hours. The cryptocurrency's daily trading volume surged 48.31% according to CMC data. The cryptocurrency sector has fallen short of analysts' predictions since July. Market analysts expected the AI bullish momentum to sustain in the second half and propel prices further. However, the crypto market witnessed tremendous crashes twice in the past few months, causing prices to plummet to previous support levels. Notably, the largest cryptocurrency Bitcoin price surpassed the \$60K resistance, yet another time in the last 24 hours. In the Asian early hours of August 19, the cryptocurrency traded at a low of \$58,404. As the day progressed, after a brief slide to the \$57K level, BTC began sparking greenish candles. Moreover, the token's positive momentum has caused quite a stir in the market. While the crypto market has shown an overall recovery in both market cap and daily trading volume, Bitcoin price also showed surges. Its daily trading volume surged 48.31% while the market price escalated 4.48%. At the time of writing, BTC was trading at \$60,980 according to CMC data. However, over the past few weeks, the token has attempted several times to initiate a trading cycle that holds prices above the \$60K level but failed. As a result, market analysts are expecting Bitcoin to hit its previous resistance at the \$65K level before it can combat bearish takeovers. Bitcoin (BTC) Price Weekly Overview In the last 7 days, Bitcoin has shown a price performance of 3.99% increase. This modest hike is due to the aforementioned trading cycles initiated by the token to combat the bears. At the beginning of the week, the token was trading at a low of \$58,971. However, as the week progressed, BTC showed high volatility and momentarily slid to a weekly low of \$56,161 on August 15. Following this, the token showed recovery and struggled to surpass the \$60K resistance until the past day. Meanwhile, Bitcoin's current short-term 9-day MA still stands below the long-term 21-day MA suggesting the overall bearish trend. However, the token's RSI stands at 51.05 indicating a buying sentiment in the market as per TradingView reports. Finally, other cryptocurrencies such as Ethereum and Solana have also shown modest price increases in the last 24 hours.

- Ethereum (ETH) investment products had \$4.2 million in inflows. - Last week, the outflow of Solana (SOL) investment products reached a record high of \$39M. A small but steady \$30 million poured into digital asset investment products during the last week. This small number, however, masks a large variation between assets and geography. Looking at the flows by geography, reveals a varied situation. The United States, Canada, and Brazil all had inflows of \$62 million, \$9.2 million, and \$7.2 million, respectively, while the two largest outflows, at \$30 million and \$14 million, respectively, were recorded in Switzerland and Hong Kong. With a total of \$42 million in inflows, Bitcoin (BTC) emerged as the clear winner. Investors' continued faith in spot Bitcoin ETFs and the BTC price is shown by this. Short-Bitcoin ETPs, on the other hand, lost \$1
